

## 1A.

### **PREGNANCIES BY PREGNANCY OUTCOME, RACE/ETHNICITY, AND AGE GROUP**

---

The expression “reproductive and perinatal health” refers to a variety of health and sociodemographic characteristics of women who became pregnant, factors related to the course of their pregnancies, and the status of pregnancy outcomes. In this report, pregnancies are measured as the sum of three components: **live births** (see Section 1B), **spontaneous terminations of pregnancy** (fetal deaths or stillbirths; Section 1C), and **abortions** (Section 1D).

There were 99,914 pregnancies in Arizona in 2014 compared to 98,762 in 2013 and 103,172 in 2009. The number of resident live births increased by 2.0 percent from 84,963 in 2013 to 86,648 in 2014 (**Table 1A-1**). The number of reported abortions decreased by 3.8 percent, from 13,254 in 2013 to 12,747 in 2014. The number of reportable spontaneous fetal losses decreased 4.8 percent from 545 in 2013 to 519 in 2014.

1A. PREGNANCIES BY PREGNANCY OUTCOME, ETHNICITY, AND AGE GROUP

**Figure 1A-1**  
**Pregnancy, Fertility, and Abortion Rates<sup>a</sup> by Outcome and Year among Females of Childbearing Ages (15 – 44 years), Arizona, 2004 - 2014**

Rate is a measure of the frequency of some event (such as pregnancy, or live birth) in relation to a unit of population during a specified time period such as a year; events in the numerator of the year occur to individuals in the denominator. The pregnancy rate increased from 76.8 pregnancies per 1,000 females of childbearing age in 2013 to 77.0/1,000 in 2014 (**Figure 1A-1, Table 1A-1**).

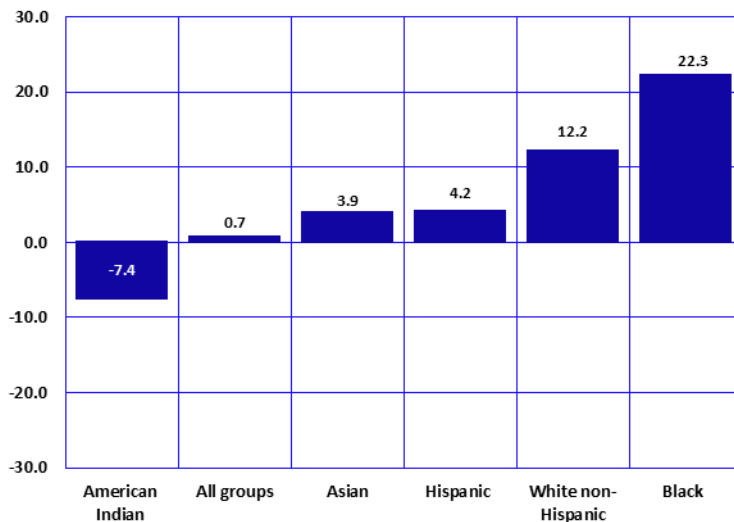

The fertility rate (the number of births per 1,000 women of childbearing age) also increased from 66.0/1,000 in 2013 to 66.7/1,000 in 2014. The fertility rate in 2014 was 16.6 percent lower than the recent high of 2006.

The abortion rate (the number of abortions per 1,000 women of childbearing age) decreased 4.9 percent from 2013 to 2014.

It is important to note that the number of females aged 15-44 years estimated in 2014 (n=1,298,305) was lower than in 2013 (n = 1,286,457).

Note: <sup>a</sup> All rates per 1,000 females in specified age group.

**Figure 1A-2**  
**Percent Change from 2011 to 2014 in the Number of Pregnancies by Woman's Race/Ethnicity, Arizona**

Overall, pregnancies in Arizona increased 0.7 percent from 2011 to 2014. The changes in number of pregnancies varied by race/ethnicity. The overall number of pregnancies increased for almost all racial/ethnic groups from 2011 to 2014, except among American Indian females. Black females (22.3 percent) and White non-Hispanic females (12.2 percent) experienced the largest percent increase in number of pregnancies from 2011 to 2014, while the number of pregnancies for American Indian females decreased 7.4 percent from 2011 to 2014 (**Figure 1A-2, Table 1A-1**).

1A. PREGNANCIES BY PREGNANCY OUTCOME, ETHNICITY, AND AGE GROUP

**Figure 1A-3**  
Trends in the Number of Pregnancies and Pregnancy Rates<sup>a</sup> among Females 19 or Younger, Arizona, 2004 - 2014

There is a difference between pregnancy rates and the absolute number of pregnancies. The teen pregnancy rate measures the proportion of teenagers becoming pregnant in a given year; in other words, the relative "risk for pregnancy" in a population "at risk". The number of pregnancies is also determined by the size of the population "at risk": or in this case, by the number of teenage females in the population.

The number of teen pregnancies decreased by 47.3 percent from 15,038 in 2007 to 7,924 in 2014 (Figure 1A-3). The teen pregnancy rate declined even more, by 48.2 percent, from 34.4 pregnancies per 1,000 females 10-19 years in 2007 to 17.8/1,000 in 2014. The number of teenage pregnancies and the teen pregnancy rate of 2014 were the lowest recorded since at least 1980.

Note: <sup>a</sup> Pregnancy rate is the number of pregnancies per 1,000 females in specified age group.

**Figure 1A-4**  
Pregnancy Rates<sup>a</sup> by Age Group and Year among Females 19 or Younger, Arizona, 2004 - 2014

The pregnancy rate for Arizona teenagers 15-19 years old in 2014 was 35.7 pregnancies per 1,000 females (Figure 1A-4, Table 5A-2), 5.3 percent lower than 2013 and 47.8 percent lower than in 2007. The pregnancy rate for younger teenagers 15-17 years old declined by 56.4 percent (Table 1A-3) from 36.9/1,000 in 2007 to 16.1/1,000 in 2014. The pregnancy rate for older teenagers 18-19 years old declined by 46.3 percent from 121.4/1,000 in 2007 to 65.2/1,000 in 2014 (Table 1A-4).

County-level information about teen pregnancies and pregnancy rates is provided in Table 5A-2, Table 5A-3, and Table 5A-5. Pregnancy statistics for Arizona are not available on a sub-county level.

Note: <sup>a</sup> All rates per 1,000 females in specified age group.

1A. PREGNANCIES BY PREGNANCY OUTCOME, ETHNICITY, AND AGE GROUP

**Figure 1A-5**  
**Comparison of Pregnancy Rates<sup>a</sup> by Race/Ethnicity and Year among**  
**Females 19 or Younger in Arizona, 2004, and 2014**

Note: <sup>a</sup> All rates per 1,000 females in specified age group.

Teen pregnancy rates differ by race/ethnicity.

Between 2004 and 2014, pregnancy rates among females aged 19 and younger declined for all racial/ethnic groups (**Figure 1A-5**). The steepest decline in teenage pregnancy rates was recorded for Asian females, who experienced a 71.5 percent drop from 2004 to 2014. The Hispanic teenage pregnancy rate decreased 57.1 percent from 59.2 in 2004 to 25.4 in 2014, representing a much larger decline in the absolute number of pregnant teenage Hispanics compared to Asians.

The changes in annual teen pregnancy rates from 2004 to 2014 are shown in detail below.

**Figure 1A-6**  
**Pregnancy Rates<sup>a</sup> by Race/Ethnicity and Year among Females**  
**19 or Younger, Arizona, 2004 - 2014**

Note: <sup>a</sup> All rates per 1,000 females in specified age group.

The teen pregnancy rates for all racial/ethnic groups were lower in 2014 than in 2004 (**Figure 1A-6**). Compared to 2013, the teen pregnancy rate decreased for all racial/ethnic groups, except for Hispanics and Whites.

From 2013 to 2014, teenage pregnancy rates decreased 35.3 percent for American Indian females, 32.7 percent for black females and 19 percent for Asian or Pacific Islander females, while the rate increased among Hispanic or Latino females and more so among White non-Hispanic females.

1A. PREGNANCIES BY PREGNANCY OUTCOME, ETHNICITY, AND AGE GROUP

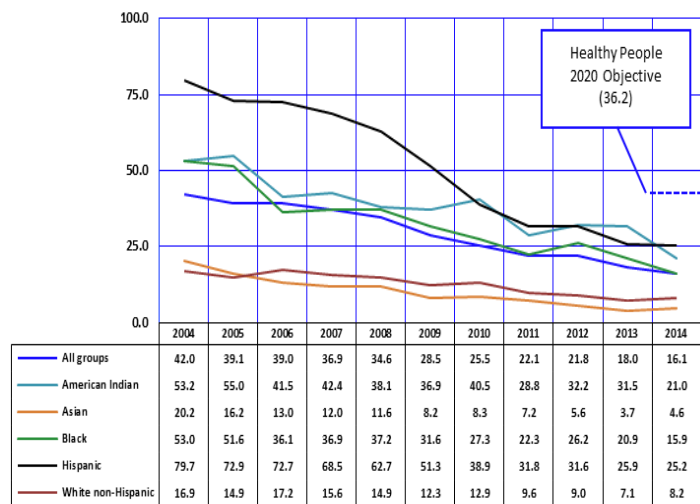

**Figure 1A-7**  
**Proportional Contribution by Race/Ethnicity to Pregnancies and Live Births among Females 19 or Younger, Arizona, 2014**

In 2014, Hispanic females accounted for approximately 38.6 percent of all females 10-19 years old in Arizona. As in the past, they accounted for a large percentage of teen pregnancies (55.1 percent) and live births (57.6 percent; **Figure 1A-7**). In contrast, White non-Hispanic females made up a larger proportion of all females 10-19 years old in Arizona, but had a lower proportional contribution to teen pregnancies (28.5 percent) and live births (26.5 percent). Note: percentages are based on the number of pregnancies and births in **Table 1A-5**.

In 2014, the pregnancy rate of 16.1 pregnancies per 1,000 adolescent females 15-17 years old in Arizona was 55.5 percent lower than the **Healthy People 2020** objective of 36.2/1,000 (**Figure 1A-8, Table 1A-3**). For all racial/ethnic groups in Arizona, the pregnancy rates for females age 15-17 years were below the Healthy People 2020 objective. The 2014 pregnancy rate among Asians age 15-17 was 7.9 times lower than the objective and among White non-Hispanics 4.4 times lower than the objective. While lower than the 2020 objective, the pregnancy rates of American Indians, Hispanics, and Blacks were substantially higher than their White non-Hispanic and Asian counterparts.
