RISK PROFILE OF AMERICAN INDIANS IN ARIZONA:

AN OVERVIEW OF SELECTED HEALTH PROBLEMS AND HEALTH RISKS AMONG AMERICAN INDIANS AND ALL RESIDENTS OF THE STATE IN 2020

The risk profile presented on the following page summarizes how American Indians as a group compared in 2020 to the state average on 66 measures of health status. The 66 indicators used in the profile are individual measures of the various dimensions or facets of health status. The profile uses the percentages a racial/ethnic group is above or below the statewide average on each of the specific measures. In order to represent the level of each indicator for American Indians in comparison to the overall state level, the following formula was used:*

$$\left[\frac{\text{THE VALUE OF A RATE OR RATIO IN A SPECIFIED GROUP}}{\text{THE AVERAGE VALUE OF A RATE OR RATIO FOR ALL GROUPS}} - 1.0 \right] \times 100$$

The above formula produces a score of 0.0 for a group with the same value as the statewide average. A negative value indicates better than average standing on an indicator. A positive value indicates worse than average standing on an indicator*. The profile visually describes the better-than-average and worse-than-average clusters of health status characteristics for American Indian residents of Arizona.

Following the graphic profile is a detailed description of the 66 indicators. These indicators are organized around 9 major subject areas:

(1) Teen Pregnancies, (2) Maternal Lifestyle and Health Characteristics, (3) Utilization of Prenatal Care Services, (4) Newborn's Health, (5) Mortality from Natural Causes (chronic or infectious diseases), (6) Mortality from Injuries, (7) Age-Specific Mortality, (8) Premature Mortality and (9) Reportable Diseases.

IN 2020, AMERICAN INDIAN RESIDENTS OF ARIZONA:

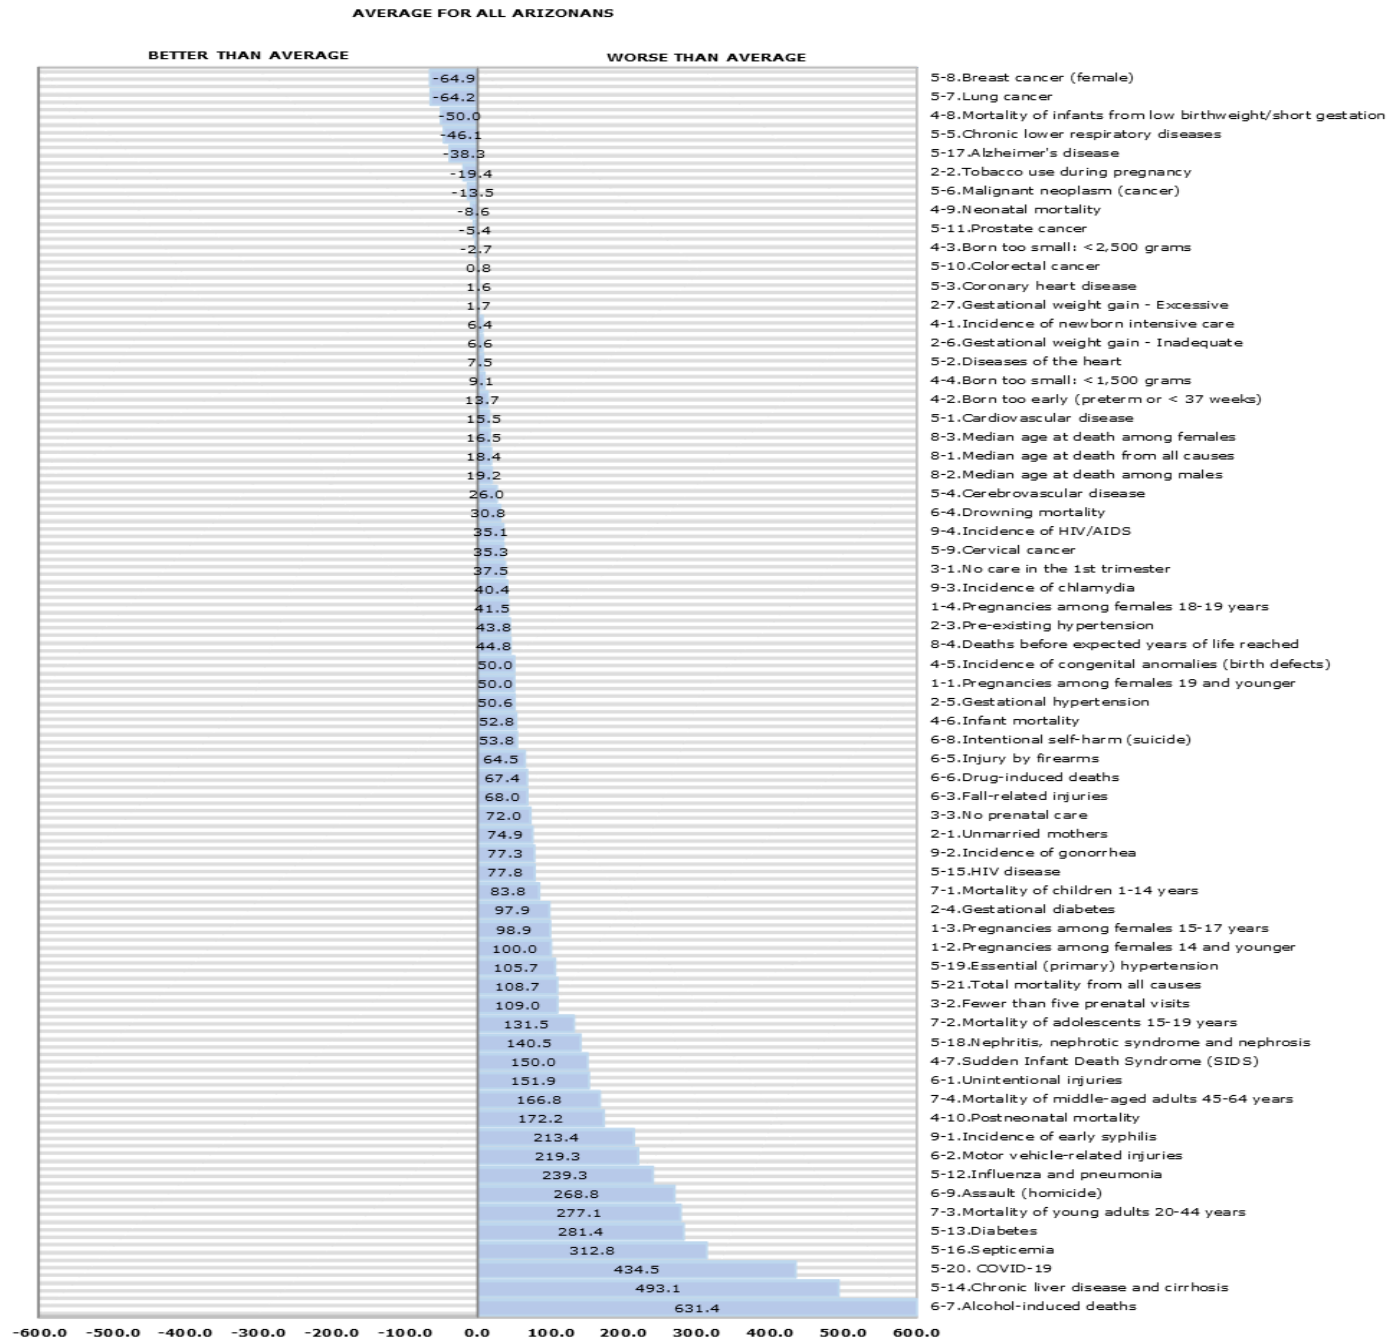

- **ranked better than average on a number of health indicators including: mortality rates for several chronic diseases including breast cancer, lung cancer, chronic lower respiratory disease, Alzheimer's disease, malignant neoplasms, and prostate cancer;**
- **ranked worse than the statewide average on 56 of 66 health indicators;**
- **had high mortality from alcohol-induced causes, chronic liver disease and cirrhosis, COVID-19, septicemia, diabetes, assault, influenza and pneumonia, motor vehicle accidents, post-neonatal mortality, and unintentional injuries ranked worse on measures of maternal lifestyle and health, as well as in utilization of prenatal care;**
- **on average were 14 years younger at time of death compared to all racial/ethnic groups.**

* The comparative risk profiles for American Indian or Alaska Native, White non-Hispanic, Hispanic or Latino, Black or African American, and Asian or Pacific Islander residents of Arizona were developed for a report "***Differences in the Health Status among Racial/Ethnic Groups***". This publication is available online at <http://pub.azdhs.gov/health-stats/report/dhsag/index.php>.

For consistency, the signs + and - for scores indicating the median age at death as higher or lower than the statewide average were reversed (indicators 8-1, 8-2, 8-3). Otherwise, a lower-than-average median age at death would signify a better than average standing on these indicators. A lower-than-average median age at death obviously reflects a worse off life expectancy.
