### **2D. PATTERNS OF PREMATURE MORTALITY**

## 2A.

### TOTAL MORTALITY

---

The total number of deaths from all causes among Arizona residents increased by 2.9 percent from 2013 ( $n = 49,929$ ) to 2014 ( $n = 51,074$ ; **Table 2A-1**). The age-adjusted mortality rate for all causes of death also increased from 687.8/100,000 in 2013 to 676/100,000 in 2014.

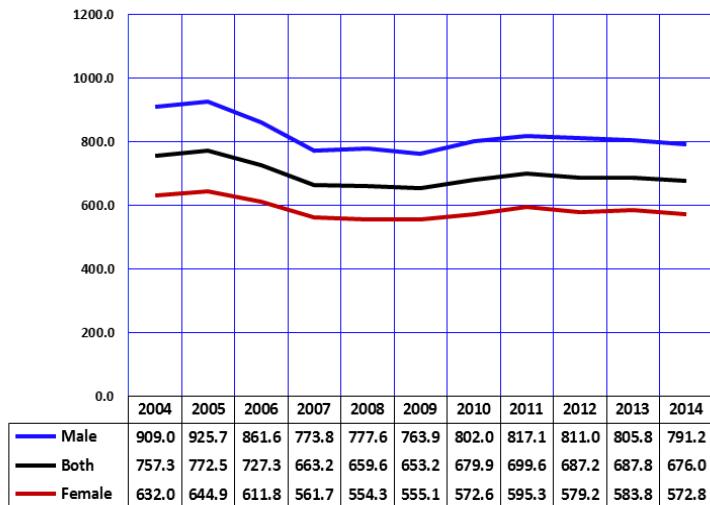

Compared to 2013, there were fewer deaths in 2014 for some of the leading causes of mortality including homicide (23.2 percent) nephritis (9.7 percent), influenza and pneumonia (7.6 percent), chronic liver disease and cirrhosis (5.4 percent), malignant neoplasms (5.3 percent) and cerebrovascular disease (2.5 percent). The causes with the largest increases were essential primary hypertension and hypertensive renal disease (6.6 percent), and diabetes (1.8 percent).

When considering race/ethnicity and gender, the age-adjusted mortality rate for deaths due to major cardiovascular diseases among Black or African Americans males decreased 28 percent from 2013 to 2014. In terms of mortality due to diabetes, the overall mortality rate for males and females remained stable over 2012 and 2013 (**Figure 2B-18**), a welcome respite from the increase observed from 2010 to 2011. Unfortunately the decrease in deaths due to diabetes did not hold true for all groups, with the age-adjusted mortality rate among Asian or Pacific Islander males increasing 63 percent from 2013 to 2014 and increasing 2.2 percent for Hispanic males over the same period.

## 2A. TOTAL MORTALITY

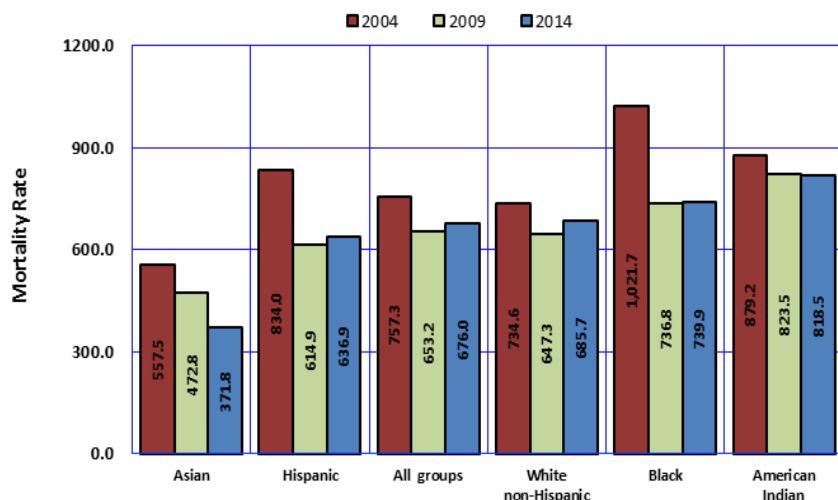

**Figure 2A-1**  
**Age-adjusted Mortality Rates<sup>a</sup> for all Causes by Gender and Year,  
Arizona, 2004-2014**

Notes: <sup>a</sup> Number of deaths per 100,000 persons (adjusted to the 2000 standard U.S. population).

---

**Figure 2A-2**  
**Age-adjusted Mortality Rates<sup>a</sup> for all Causes by Race/Ethnicity and Year,  
Arizona Residents, 2004, 2009, and 2014**

Notes: <sup>a</sup> Number of deaths per 100,000 persons (adjusted to the 2000 standard U.S. population).

---

The age-adjusted mortality rates discussed below are based on the year 2000 population standard. All mortality rates in sections 2A and 2B are age-adjusted. A detailed explanation of the age-adjustment of mortality rates is given in the **Technical Notes**.

The total age-adjusted mortality rate decreased by 1.7 percent from 687.8 in 2013 to 676 in 2014 (**Figure 2A-1, Table 2B-2**). Over this period, the age-adjusted mortality rates decreased for both males and females.

The difference between male and female mortality rates narrowed slightly between 2004 and 2014 with the male age-adjusted mortality rate being 43.8 percent greater than the female age-adjusted mortality rate in 2004, and 38.1 percent greater in 2014. However, the parallel trend lines (**Figure 2A-1**) do not suggest that the full convergence in mortality risk between males and females is likely to happen in the near future.

The 2014 age-adjusted death rates for the major racial/ethnic groups were as follows: for Asian or Pacific Islander, 371.8 deaths per 100,000 population; Hispanic or Latino, 636.9; White non-Hispanic, 685.7; American Indian or Alaska Native, 818.5; and Black or African American, 739.9 (**Figure 2A-2, Table 2B-4**).

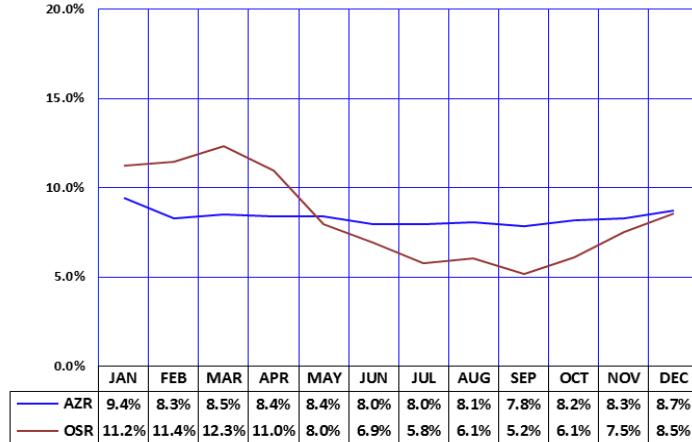

In 2014, as in 2004 and 2009, Blacks and American Indians had higher total mortality rates than White non-Hispanics, Hispanics, and Asians. The total mortality rates for Asians were lower than the rates of both White non-Hispanics and Hispanics in 2004, 2009, and 2014.

## 2A. TOTAL MORTALITY

**Figure 2A-3**  
**Percent Annual Deaths by Month of Occurrence and Residence Status, Arizona, 2014**

If there was no monthly variation in proportional contribution to total annual deaths, 8.3 percent (100/12) of deaths should occur monthly. However, when the monthly distribution of resident deaths is examined, January (9.4 percent), December (8.7 percent), March (8.5 percent), and both April and May (8.4 percent) were higher in 2014 from the expected value (**Figure 2A-3**). September, June, July, August, October, and November were the months with the lowest proportional contributions to the total annual deaths among Arizona residents.

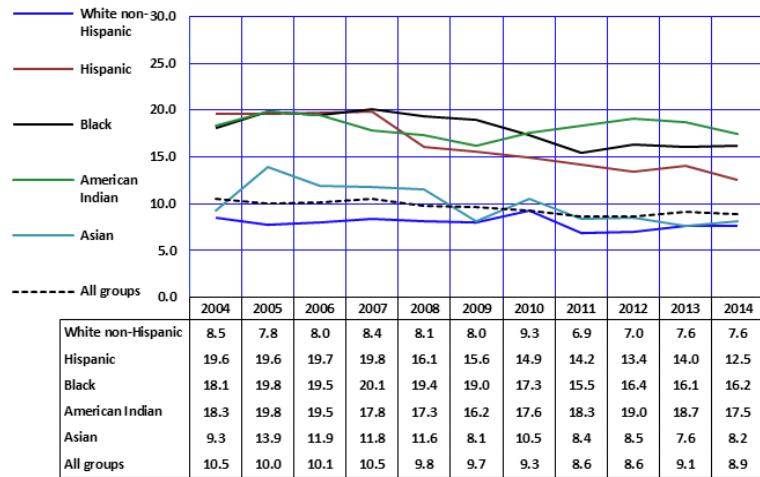

The majority of the 2,023 non-residents who died in Arizona during 2014 did so during March, February, January, and December. September was the month with the lowest proportional contribution (5.2 percent) to the annual death total among out-of-State residents who died in Arizona.

**Figure 2A-4**  
**Percentage of Deaths for which Autopsies were Reported by Race/Ethnicity and Year, Arizona Residents, 2004-2014**

Autopsies were reported as performed on 4557 decedents, or 8.9 percent of the deaths that occurred among Arizona residents in 2013. From 2004 – 2014, the percentage of deaths for which autopsies were reported varied from a high of 10.5 percent in 2004 and 2007 to a low of 8.6 percent in 2011 and 2012.

The percentage autopsied varies by the decedent's demographic characteristics. By race/ethnicity (**Figure 2A-4**) the percentage autopsied was lower for the White non-Hispanic and Asian population than for other groups. The prevalence of autopsies was substantially greater among American Indian, Black, and Hispanic or Latino sub-populations. A substantial portion of the differential in the use of autopsy by race/ethnicity reflects differences in the age and manner of death. For example, autopsies tend to be more common at younger ages and for deaths by homicide, suicide, accidents, and undetermined manner.

## 2B.

### **LEADING CAUSES OF DEATH**

---

In 2010, the Office of Vital Records (OVR) of the Arizona Department of Health Services implemented the new (2003) Standard U.S. death certificate. The new certificate added several new questions: 1) whether tobacco use contributed to the death, and 2) whether, if the decedent was a female, the death was "pregnancy-associated" (defined as death from any cause during pregnancy or within one calendar year of delivery or pregnancy termination).

The death certificate now includes a new classification of the decedent's racial/ethnic status, consistent with the revised federal standards for collecting and reporting racial and ethnic status. These standards were published in the Federal Register on October 30, 1997, as "Revisions to the Standards for the Classification of Federal Data on Race and Ethnicity". The revised standards are available on the OMB (the Office of Management and Budget) web-site at: <http://www.whitehouse.gov/omb/fedreg/ombdir15.html>

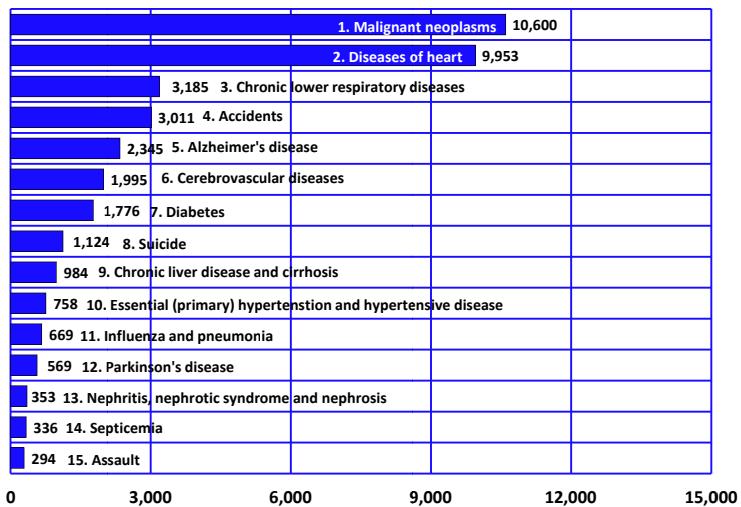

There are now 15 racial categories (including Guamanian or Chamorro; Samoan or Native Hawaiian) to choose from. It is also permitted to indicate more than one race for a decedent. In 2014, among the 51,074 deaths of Arizona residents, indication of "two or more races" appeared on only 465 certificates. The total number of deaths for decedents identified as Native Hawaiian was 14. To create frequency counts of race and ethnicity that were adequate to compute statistically reliable mortality rates, race was "bridged", or essentially collapsed into 5 categories; White non-Hispanic, Hispanic or Latino, Black or African American, Native American or Alaska Native, and Asian or Pacific Islander. When an individual was identified as both Hispanic and any other race, that person was added to the racial/ethnic group with the lowest population. For example, a person identified as both White and Hispanic would be coded as Hispanic, where a person identified as American Indian and Hispanic would be coded as American Indian. Please refer to the technical appendix for further explanation of the racial bridging used in this report.

## 2B. LEADING CAUSES OF DEATH

---

**Figure 2B-1A**  
**Leading Causes of Death among Arizona Residents in 2014**

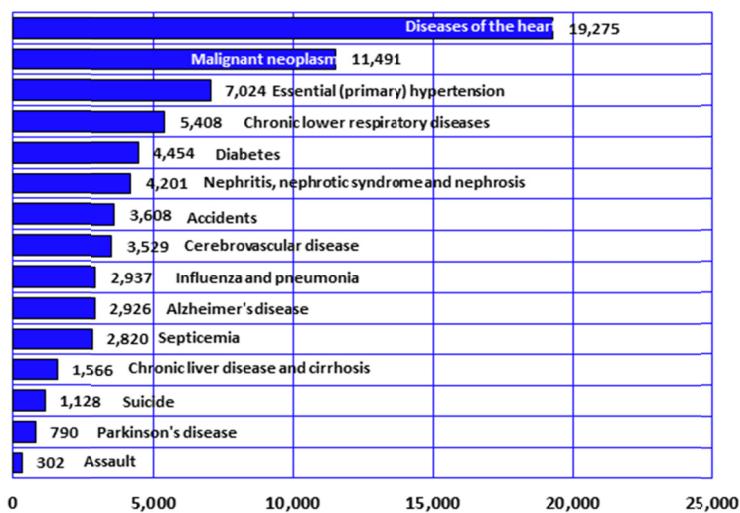

**BASED ON THE NUMBER OF DEATHS DUE TO THE UNDERLYING CAUSE:**

Based on the number of deaths (but not age-adjusted mortality rate), the leading underlying cause of death to Arizona residents in 2014 was cancer (10,600 or 20.8 percent of all deaths), closely followed by *heart disease*, which accounted for 9,953 or 19.5 percent of deaths (**Figure 2B-1A, Table 2B-1, Table 5E-14**). The third leading cause of death, *chronic lower respiratory diseases*, accounted for 3,185 or 6.2 percent of total deaths. Deaths due to *accidents (unintentional injuries)* ranked fourth in 2014, with 3,011 resident deaths reported. Deaths due to *Alzheimer's disease* ranked fifth in 2014, with 2,345 resident deaths reported. Together, these five causes accounted for 57.0 percent of total deaths in 2014. The fifteen leading causes accounted for 74.3 percent of all deaths among Arizona residents.

**Figure 2B-1B**  
**Leading Causes of Death among Arizona Residents in 2014**

**BASED ON THE NUMBER OF DEATHS DUE TO ANY MENTION OF A CAUSE:**

For the purpose of mortality statistics, every death is attributed to one underlying condition or underlying cause of death. The underlying cause is defined as the disease or injury that initiated the chain of events leading directly to death. It is selected from up to 20 causes and conditions entered by the physician on the death certificate. The totality of all these conditions is known as multiple cause of death.

In addition to 10,600 deaths that had diseases of the heart assigned as the underlying cause, another 8,675 deaths had diseases of the heart assigned as a secondary cause of death. The sum of these two counts (19,275, **Figure 2B-1B**) is the total number of deaths that had any mention of diseases of the heart on the 2014 death certificates. The ranking based on any mention of the 15 diagnostic categories is different from ranking of the leading causes of death based on the underlying cause. In particular, *essential (primary) hypertension* ranked 10<sup>th</sup> as the underlying cause but ranked 3<sup>rd</sup> when any mention of it was counted.

## 2B. LEADING CAUSES OF DEATH

### Five Leading Causes by Gender

---

It is important to note that (**Figures 2B-2, 2B-3, 2B-4, and 2B-5**) are based on the age-adjusted mortality rates and not on the number of deaths.

In 2014, cancer was the number one cause of death for Asians or Pacific Islanders, Blacks or African Americans Hispanic or Latinos, and White non-Hispanics. Diseases of the heart were the leading cause of death specific to American Indians (**Figure 2B-2, Table 2B-4**). Unintentional injury was the third leading cause of death only for American Indians. For both Hispanics, and Whites, Alzheimer's disease was the 5<sup>th</sup> leading cause of death in 2014. Diabetes was among the fourth leading cause of death for American Indians and Blacks (**Table 2B-4**).

Chronic liver disease and cirrhosis was the fifth leading cause of death specific to American Indians. Chronic lower respiratory diseases were the third leading cause of death specific to White non-Hispanics.

**Figure 2B-2**  
**Age-adjusted Mortality Rates<sup>a</sup> for the Five Leading Causes of Death for Both Genders by Race/Ethnicity, Arizona, 2014**

Rank	Asian or Pacific Islander	American Indian or Alaska Native	Black or African American	Hispanic or Latino	White non-Hispanic
1	Cancer 83.2	Diseases of heart 107.5	Cancer 145.0	Cancer 124.9	Cancer 141.8
2	Diseases of heart 60.3	Cancer 97.1	Diseases of heart 140.9	Diseases of heart 114.0	Diseases of heart 134.4
3	Stroke 28.7	Unintentional injury 85.4	Stroke 40.8	Diabetes 39.1	Chronic lower respiratory diseases 45.9
4	Unintentional injury 18.3	Diabetes 63.2	Diabetes 39.7	Unintentional injury 35.9	Unintentional injury 43.7
5	Chronic lower respiratory diseases 17.3	Chronic liver disease and cirrhosis 52.7	Unintentional injury 37.6	Alzheimer's disease 34.1	Alzheimer's disease 31.1

Note: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

**Figure 2B-3**  
**Age-adjusted Mortality Rates<sup>a</sup> for the Five Leading Causes of Death by Race/Ethnicity among Females, Arizona, 2014**

Rank	Asian or Pacific Islander	American Indian or Alaska Native	Black or African American	Hispanic or Latino	White non-Hispanic
1	Cancer 83.5	Cancer 77.3	Cancer 140.9	Cancer 103.4	Cancer 121.8
2	Diseases of heart 49.9	Diseases of heart 70.3	Diseases of heart 113.3	Diseases of heart 87.0	Diseases of heart 104.1
3	Stroke 25.8	Chronic liver disease and cirrhosis 55.5	Stroke 39.2	Alzheimer's disease 38.9	Chronic lower respiratory diseases 43.0
4	Unintentional injury 19.3	Diabetes 54.5	Diabetes 37.1	Diabetes 32.6	Alzheimer's disease 34.6
5	Alzheimer's disease 16.2	Unintentional injury 47.4	Alzheimer's disease 34.9	Stroke 27.5	Unintentional injury 29.9

Note: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

## B. LEADING CAUSES OF DEATH Five Leading Causes by Gender

**Figure 2B-4**  
**Age-adjusted Mortality Rates<sup>a</sup> for the Five Leading Causes of Death  
by Race/Ethnicity among Males, Arizona, 2014**

Rank	Asian or Pacific Islander	American Indian or Alaska Native	Black or African American	Hispanic or Latino	White non-Hispanic
1	Cancer 82.1	Diseases of heart 159.3	Diseases of heart 175.3	Cancer 153.6	Diseases of heart 168.9
2	Diseases of heart 73.8	Unintentional injury 128.2	Cancer 154.7	Diseases of heart 147.8	Cancer 166.5
3	Chronic lower respiratory diseases 33.8	Cancer 124.6	Chronic lower respiratory diseases 47.4	Unintentional injury 47.3	Unintentional injury 57.7
4	Stroke 33.1	Diabetes 74.7	Unintentional injury 44.1	Diabetes 46.8	Chronic lower respiratory diseases 49.7
5	Diabetes 30.1	Chronic liver disease and cirrhosis 48.0	Diabetes 41.8	Chronic lower respiratory diseases 28.7	Intentional Self-harm Suicide 31.9

Note: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

Based on age-adjusted mortality rates, cancer followed by diseases of the heart were the two leading causes of death among Asian or Pacific Islander, and Hispanic or Latino males (**Figure 2B-4; Table 2B-4**). Age-adjusted mortality rates for diseases of the heart were the highest of all causes among American Indian, Black or African American, and White non-Hispanic males.

Unintentional injury ranked among the top 5 leading causes of death for males in all racial/ethnic groups excluding Asians, but was the 2<sup>nd</sup> leading cause of death only for American Indian males.

In 2014, based on the age-adjusted mortality rates, diabetes was among the fourth leading causes of death for American Indian, and Hispanic or Latino males, and the 5<sup>th</sup> leading causes of death for Asian and Black males.

**Figure 2B-5**  
**Age-adjusted Mortality Rates<sup>a</sup> for the Five Leading Causes of Death  
by Gender in Urban<sup>b</sup> and Rural Areas, Arizona, 2014**

Rank	Urban male	Urban female	Rural male	Rural female
1	Cancer 160.1	Cancer 115.0	Diseases of heart 191.0	Cancer 123.7
2	Diseases of heart 157.2	Diseases of heart 97.8	Cancer 163.0	Diseases of heart 112.6
3	Unintentional injury 52.2	Alzheimer's disease 37.5	Unintentional injury 76.1	Unintentional injury 40.3
4	Chronic lower respiratory diseases 45.2	Chronic lower respiratory diseases 37.0	Chronic lower respiratory diseases 47.7	Chronic lower respiratory diseases 39.6
5	Diabetes 30.1	Unintentional injury 28.3	Intentional Self-harm Suicide 40.6	Stroke 29.7

Notes: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard; <sup>b</sup> Urban counties include Maricopa, Pima, Pinal, and Yuma counties.

Notes: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard; <sup>b</sup> Urban = Maricopa, Pima, Pinal and Yuma counties. The remaining counties comprise Arizona's rural areas.

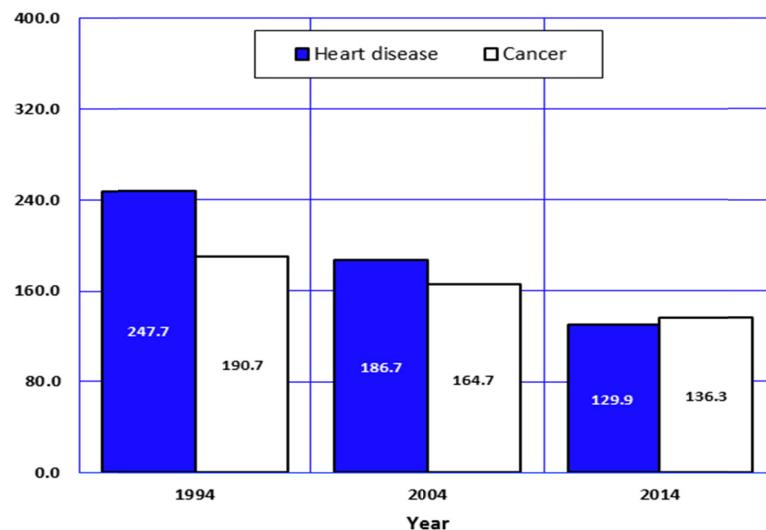

In 2014, the profile of the leading causes of death differed by gender for residents of the urban (Maricopa, Pima, Pinal, and Yuma counties) and rural (all the remaining counties) areas of the state. (**Figure 2B-5, Table 2B-5**). Cancer exceeded diseases of the heart as the leading causes of death among both urban males and urban females and rural females. Alzheimer's disease was the 3<sup>rd</sup> leading cause of death among urban females. Suicide was the 5<sup>th</sup> leading cause of death specific to rural males.

## 2B. LEADING CAUSES OF DEATH Diseases of heart and malignant neoplasm (cancer)

The age-adjusted mortality rate for diseases of the heart decreased by 47.6 percent from 247.7 deaths per 100,000 population in 1994 to 129.9/100,000 in 2014 (**Figure 2B-6**). The age-adjusted mortality rate for cancer declined less, by 28.5 percent, from 1994-2014. In Arizona, the relative risk of death from heart disease versus cancer changed from 29.9 percent greater in 1994 to 4.7 percent less in 2014.

In 2004, 896 more Arizonans died from diseases of the heart than cancer (**Table 2B-1**). In 2014, the number of deaths from cancer exceeded the number of heart disease deaths by 647 (**Table 2B-4**).

**Figure 2B-6**  
**Comparison of Age-adjusted Mortality Rates<sup>a</sup> for Heart Disease and Cancer (Malignant Neoplasm), Arizona, 1994, 2004, and 2014**

Note: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

**Figure 2B-7**  
**Number of Deaths from Heart Disease and Cancer among Arizonans 0-84 Years, 2004-2014**

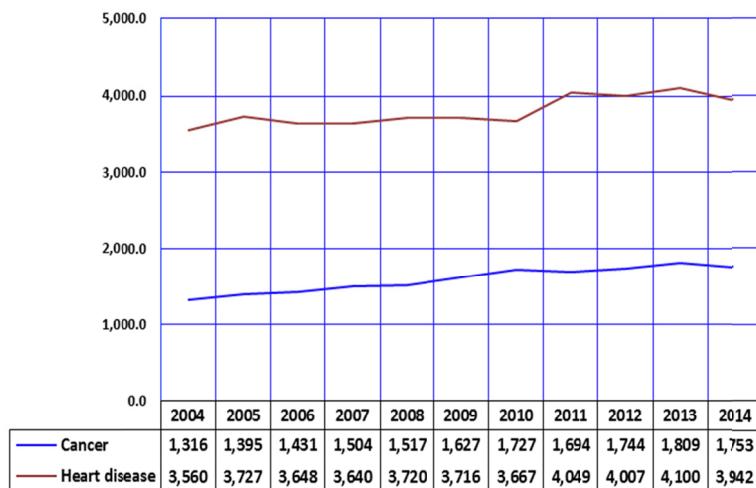

For the past several years, cancer has been the number one cause of death among Arizonans aged 0-84 years (**Figure 2B-7**). Beginning in 1996, the annual number of cancer deaths exceeded the number of deaths from heart disease. In 2014, 2,836 more Arizonans 0-84 years old died from cancer (8,847) than heart disease (6,011).

**2B. LEADING CAUSES OF DEATH**  
Diseases of heart and malignant neoplasm (cancer)

---

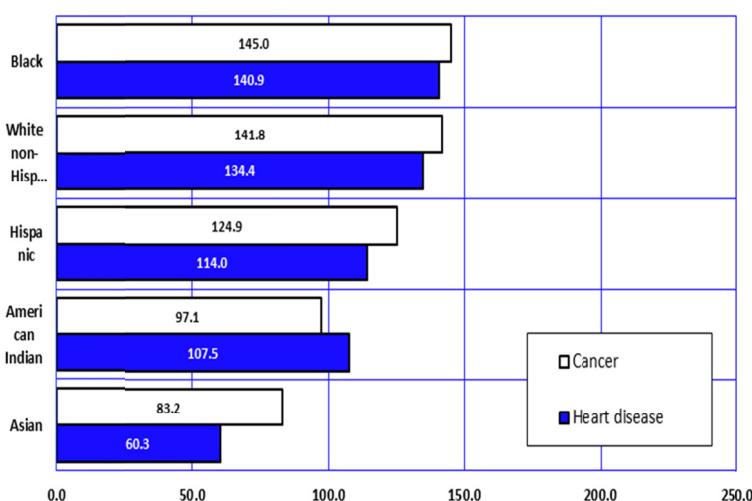

**Figure 2B-8**  
**Deaths from Heart Disease and Cancer among Arizonans 85+, 2004-2014**

Among Arizonans age 85 and over, heart disease is the number one leading cause of death by a wide margin. In 2014, adults aged 85 and over accounted for 16.5 percent of all deaths from cancer but 39.6 percent of all deaths from heart disease. In 2014, the median age at death for heart disease was 81 years (**Table 2D-3**) and a minority of deaths (43.4 percent, **Table 2D-4**) were premature, i.e., before reaching the expected years of life at birth for all U.S. residents (78.8 years).

However, from 2004 to 2014, the number of deaths from cancer increased by 33.2 percent among Arizonans 85 years or older, more than 3 times the increase observed in diseases of the heart (10.7 percent increase).

**Figure 2B-9**  
**Age-adjusted Mortality Rates<sup>a</sup> for Heart Disease and Cancer by Race/Ethnicity, Arizona, 2014**

Arizona's White non-Hispanics were 2.2 times more likely to die from diseases of the heart and 1.7 times more likely to die from malignant neoplasms in 2014 than Asians, the group with the lowest risk of each respective cause of death (**Figure 2B-9, Table 2B-4**). Compared to Asians, Black or African American Arizonans were 1.7 times more likely to die of cancer and 2.3 times more likely to die of heart disease.

For all the racial/ethnic groups, except the American Indians, the relative risk of death from cancer exceeded the mortality risk of death from heart disease in 2014 (**Table 2B-3**).

Note: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

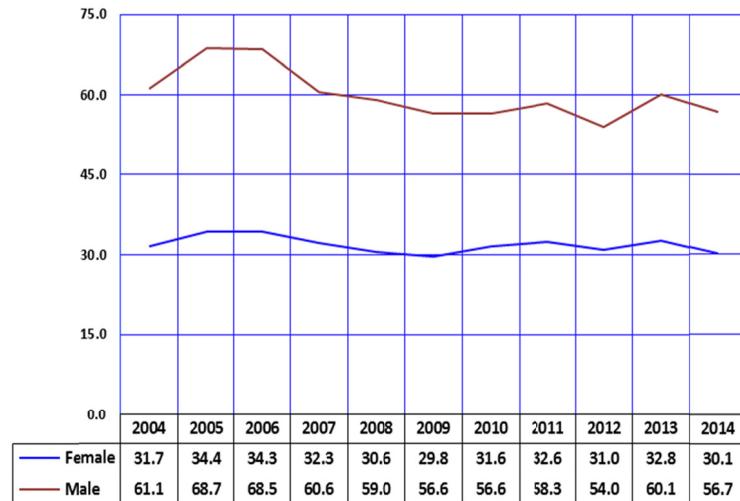

## 2B. LEADING CAUSES OF DEATH Accidents (unintentional injury)

---

The number of deaths from unintentional injuries increased by 4.0 percent from 3,137 in 2013 to 3,011 in 2014 (**Table 2B-1**). In 2014, based on age-adjusted mortality rates, accidents ranked third as a leading cause of death for males and fifth for females (**Table 2B-4**). From 2013 to 2014, the age-adjusted mortality rate for accidents decreased 5.7 percent for males and 8.2 percent for females (**Figure 2B-10**).

In 2014, 702 deaths were caused by motor vehicle accidents, a decrease of 8.5 percent from 2013. Additionally, Arizonans experienced a 3.8 percent increase in the number of accidental drug poisonings due to drugs and /or medicaments from 2013 (n=853) to 2014(n=885). (**Table 2B-9**). Deaths due to mechanical suffocation increased 66 percent over this period.

**Figure 2B-10**  
**Age-adjusted Mortality Rates<sup>a</sup> for Accidents (Unintentional Injuries) by Gender and Year, Arizona, 2004-2014**

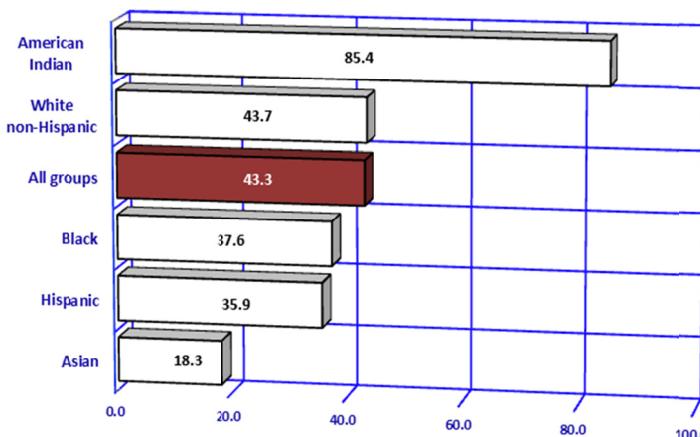

Note: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

---

**Figure 2B-11**  
**Age-adjusted Mortality Rates<sup>a</sup> for Accidents (Unintentional Injuries) by Race/Ethnicity, Arizona, 2014**

The American Indian death rate for unintentional injuries (85.4/100,000) was 4.7 times greater than the rate for Asians (18.3/100,000), the group at the lowest risk of unintentional injury death among racial/ethnic groups in the State (**Figure 2B-11, Table 2B-4**).

In 2014, Navajo (94.1/100,000) and Apache (91.9/100,000) counties had the two highest age-adjusted mortality rates for unintentional injuries (**Table 5E-11**).

Note: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

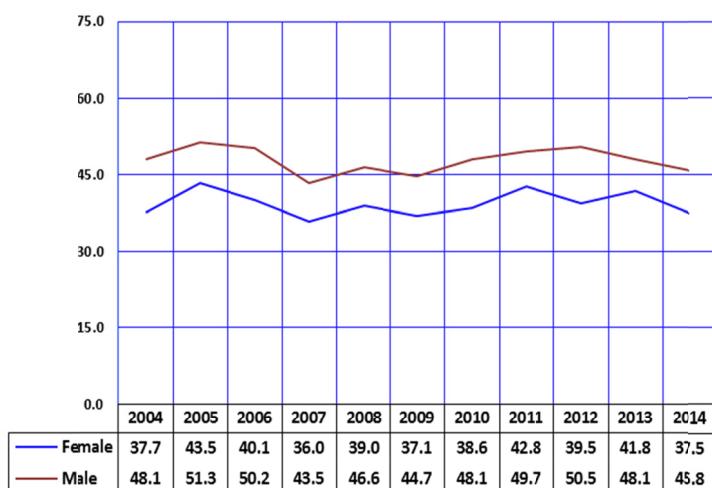

---

## 2B. LEADING CAUSES OF DEATH

### Chronic lower respiratory diseases

---

**Figure 2B-12**  
**Age-adjusted Mortality Rates<sup>a</sup> for Chronic Lower Respiratory Diseases<sup>b</sup> by Gender and Year, Arizona, 2004-2014**

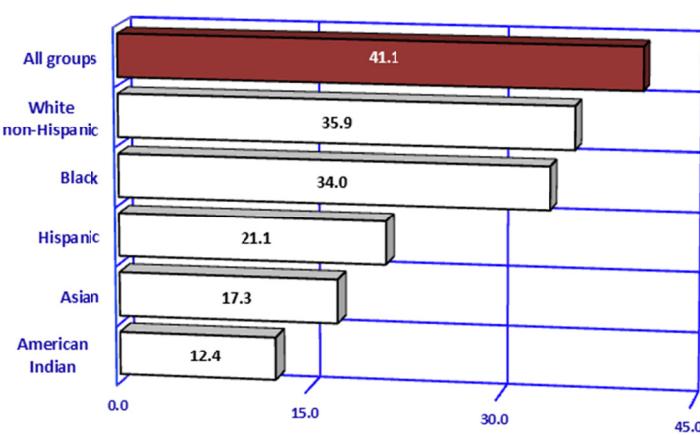

In 2014, chronic lower respiratory diseases (bronchitis, emphysema, asthma) were the 3rd leading cause of death among Arizona residents (**Table 2B-1**). From 2013 to 2014, the mortality rates for chronic lower respiratory diseases decreased for both genders (**Figure 2B-12, Table 2B-2**).

Urban females had the lowest mortality rate for chronic lower respiratory diseases (37.0/100,000) among the genders and by regional group (**Table 2B-5**). Rural males were the group with the highest mortality risk for chronic lower respiratory diseases (47.7/100,000), followed by urban males (45.2/100,000) and rural females (39.6 deaths per 100,000).

Notes: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard; <sup>b</sup>This ICD-10 title corresponds to Chronic Obstructive Pulmonary Disease (ICD-9 title).

**Figure 2B-13**  
**Age-adjusted Mortality Rates<sup>a</sup> for Chronic Lower Respiratory Diseases by Race/Ethnicity, Arizona, 2014**

Mortality rates for emphysema, chronic bronchitis, asthma, and other lower respiratory disorders were substantially higher among White non-Hispanics (35.9 deaths per 100,000) and Black or African Americans (34.0/100,000) than they were among Hispanics, (21.1/100,000), Asians (17.3/100,000), and American Indians (12.4/100,000; **Figure 2B-13, Table 2B-4**).

Notes: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

## 2B. LEADING CAUSES OF DEATH Cerebrovascular disease

---

Cerebrovascular disease and diseases of the heart are two of the leading causes of death that share many risk factors such as hypertension, smoking, obesity, and high levels of cholesterol. The age-adjusted mortality rate for stroke decreased by 39.9 percent from 43.6 deaths per 100,000 population in 2004 to 26.2 /100,000 in 2014 (**Table 2B-3**).

Females remained at greater risk than males to die from a stroke from 2004-2011. In 2012, the age-adjusted mortality rate for stroke was greater among males than females, with male risk being slightly higher than female risk (**Figure 2B-14**). In 2013-2014, the stroke mortality rate for females was again greater than the rate for males (**Figure 2B-14, Table 2B-2**).

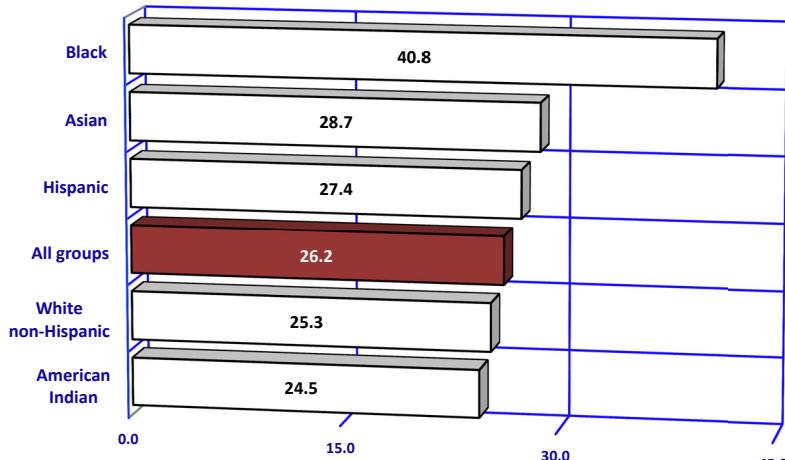

**Figure 2B-14**  
**Age-adjusted Mortality Rates<sup>a</sup> for Cerebrovascular Disease by Gender and Year, Arizona, 2004-2014**

Notes: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

---

**Figure 2B-15**  
**Age-adjusted Mortality Rates<sup>a</sup> for Cerebrovascular Disease by Race/Ethnicity, Arizona, 2014**

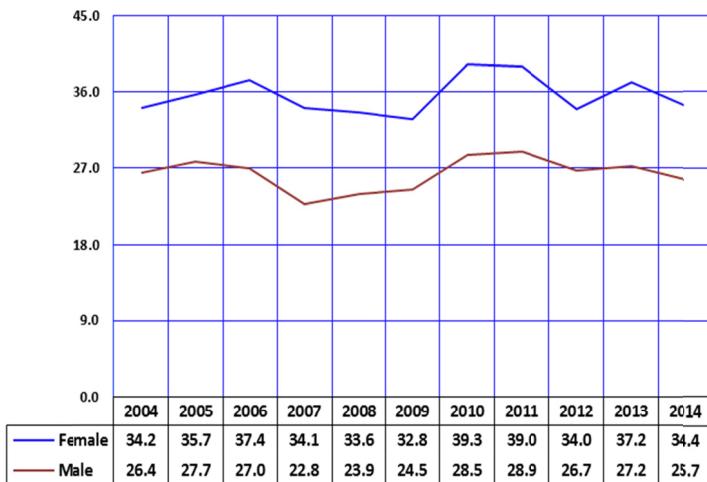

Note: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

---

## 2B. LEADING CAUSES OF DEATH Alzheimer's disease

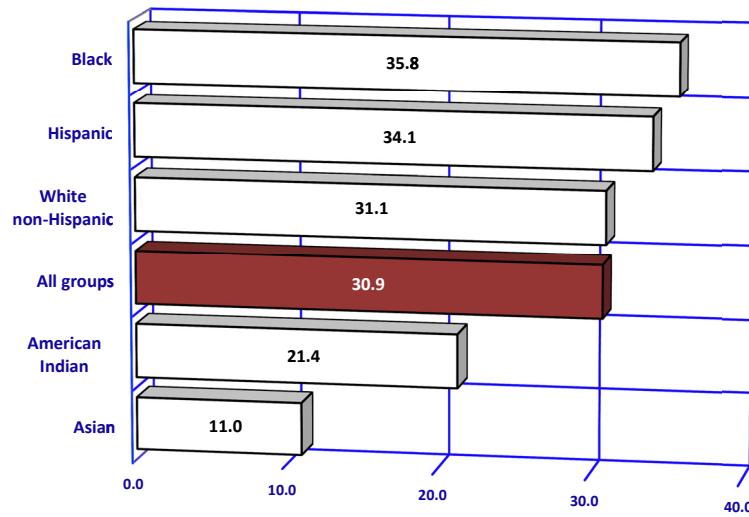

---

**Figure 2B-16**  
**Age-adjusted Mortality Rates<sup>a</sup> for Alzheimer's Disease by Gender and Year, Arizona, 2004-2014**

Note: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

**Figure 2B-17**  
**Age-adjusted Mortality Rates<sup>a</sup> for Alzheimer's Disease by Race/Ethnicity, Arizona, 2014**

Note: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

Based on the number of deaths in 2014, Alzheimer's disease was the 4<sup>th</sup> leading cause of death for females and 6<sup>th</sup> leading cause for males (**Table 2B-4**).

From 2013 to 2014, the age-adjusted mortality rate for Alzheimer's disease decreased among both genders. The decline in the age adjusted mortality rate was greater for females (7.5 Percent) than for males (5.5 percent) (**Figure 2B-16**).

The age-adjusted mortality rates for Alzheimer's disease in 2014 were higher among Black or African Americans (35.8/100,000), Hispanics (34.1/100,000), and White non-Hispanics (31.1/100,000) than among American Indian (21.4/100,000) or Asian residents of Arizona (11.0/100,000; **Figure 2B-17, Table 2B-4**).

White non-Hispanic residents of Arizona disproportionately contributed to mortality from Alzheimer's disease. In 2014, White non-Hispanics accounted for 57.6 percent (**Table 10C-1**) of the State's population, but 85.0 percent of all deaths from Alzheimer's disease (1,993 out of 2,345; **Table 2B-4**).

In 2014, the median age at death from Alzheimer's disease was 88 for females and 86 for males (**Table 2D-3**).

## 2B. LEADING CAUSES OF DEATH Diabetes

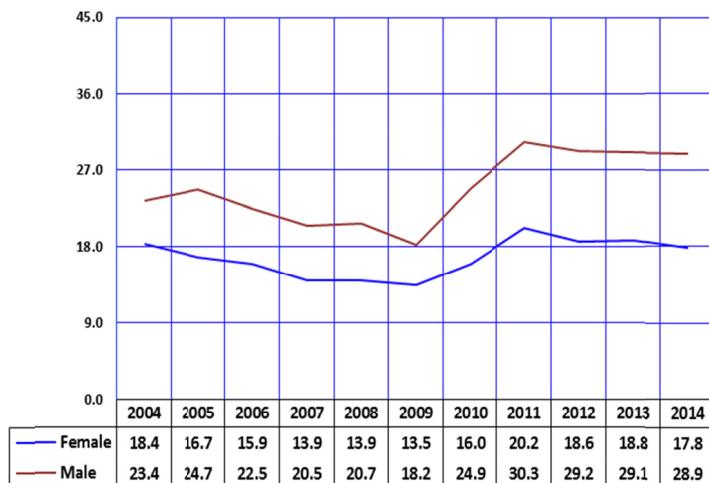

---

Both men and women experienced a decline in mortality rates for diabetes in 2014 (**Figure 2B-18**) following a period of increase during 2010 to 2013 (based on the data in **Table 2B-1**).

In addition to 1,776 deaths that had diabetes assigned as the underlying cause in 2014, another 2,678 deaths had diabetes assigned as a contributing factor. The diabetes-related death rate of 57.6/100,000 (**Table 6A-6**) was 2.5 times greater than the rate for diabetes as underlying cause (23.0/100,000, (**Table 2B-2**)).

The diabetes-related death rate includes all mentions of diabetes on the death certificate as the underlying or other than underlying cause.

**Figure 2B-18**  
**Age-adjusted Mortality Rates<sup>a</sup> for Diabetes by Gender and Year,  
Arizona, 2004-2014**

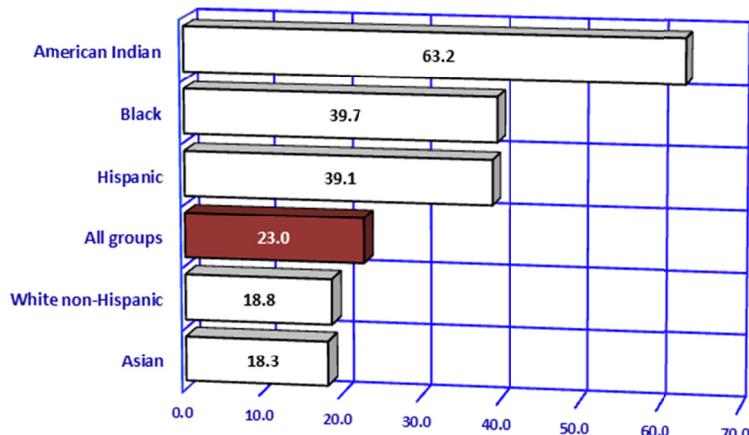

Note: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

---

**Figure 2B-19**  
**Age-adjusted Mortality Rates<sup>a</sup> for Diabetes by Race/Ethnicity,  
Arizona, 2014**

In 2014, compared to Arizona's rate, American Indians were 2.7 times more likely to die from diabetes (63.2 deaths per 100,000; **Figure 2B-19, Table 2B-4**). The rate of 18.3 deaths per 100,000 among Asians was the lowest rate among all racial/ethnic groups in the State.

Among the 15 Arizona counties, in 2014 Apache (43.9/100,000), Navajo (30.8/100,000), and Gila (30.4/100,000) counties had the highest mortality rates for diabetes (**Table 5E-11**).

Note: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

---

## 2B. LEADING CAUSES OF DEATH

### Influenza and pneumonia

---

**Figure 2B-20**  
**Age-adjusted Mortality Rates<sup>a</sup> for Influenza and Pneumonia by Gender and Year, Arizona, 2004-2014**

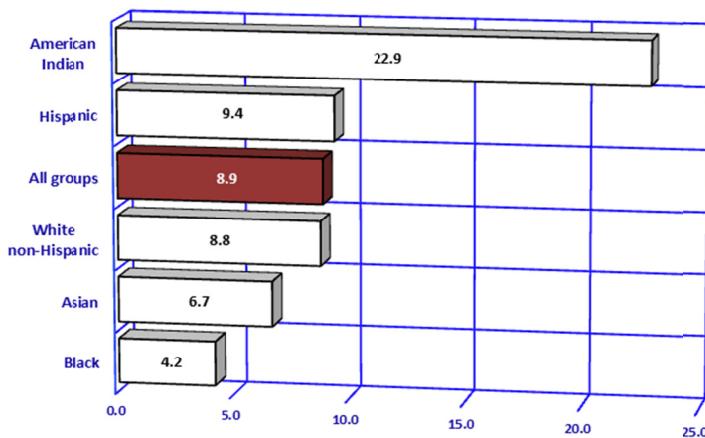

Note: <sup>a</sup> Number of deaths per 100,000 population age-adjusted 2000 U.S. standard.

The number of deaths from influenza and pneumonia decreased by 47.7 percent from a recent high of 1,280 in 2005 to 669 in 2014, though the number of influenza deaths rose 14.0 percent from 2012 to 2013 (**Table 2B-1**). Among the 669 deaths, influenza was identified as the underlying cause for 62 of them, while pneumonia was listed as the underlying cause on 607 death certificates (**Table 2B-6**).

The mortality rate for influenza and pneumonia decreased for females from 8.8 deaths per 100,000 in 2013 to 7.7 deaths in 2014 (**Figure 2B-20, Table 2B-2**). The mortality rate for influenza and pneumonia also decreased for males from 11.6 deaths per 100,000 in 2013 to 10.4/100,000 in 2014

In 2014, the age-adjusted mortality rate for Arizona males was 35.1 percent greater than that of Arizona females.

**Figure 2B-21**  
**Age-adjusted Mortality Rates<sup>a</sup> for Influenza and Pneumonia by Race/Ethnicity, Arizona, 2014**

In 2014, American Indian residents of Arizona had the highest mortality rate for influenza and pneumonia (22.9 deaths per 100,000) among the racial/ethnic groups. The age-adjusted mortality of 4.2/100,000 among Blacks was the lowest rate among racial/ethnic groups in the State (**Figure 2B-21, Table 2B-4**).

Compared to the State death rate for influenza and pneumonia, Apache County's rate was 3.1 times greater (27.9/100,000). The mortality rate was also higher in Yuma County (18.6/100,000), Graham (16.2/100,000), and Navajo County (15.1/100,000) (**Table 5E-11**).

Note: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

## 2B. LEADING CAUSES OF DEATH Suicide

---

In 2014, suicide was the 7th leading cause of death among males. It ranked as the 11th cause of mortality for females. The age-adjusted suicide rate decreased from 17.0 suicides per 100,000 in 2013 to 16.5 in 2014 (**Table 2B-4**).

From 2013 to 2014, the suicide rate remained stable for females, but decreased by 3.8 percent for males **Figure 2B-22, Table 2B-4**. In 2014, suicide posed a 3.3 times greater mortality risk for males (25.6/100,000) than for females (7.7/100,000).

**Figure 2B-22**  
**Age-adjusted Mortality Rates<sup>a</sup> for Suicide by Gender and Year,  
Arizona, 2004-2014**

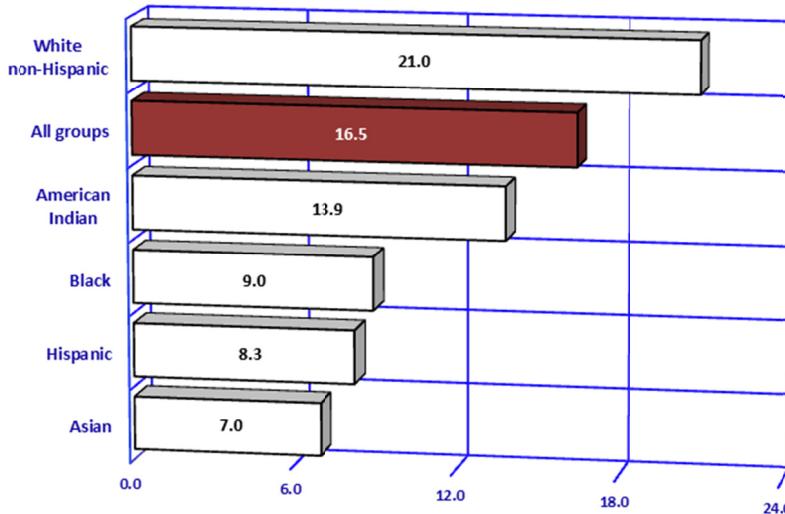

Note: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

---

**Figure 2B-23**  
**Age-adjusted Mortality Rates<sup>a</sup> for Suicide by Race/Ethnicity,  
Arizona, 2014**

In 2014, White non-Hispanics had the highest age-adjusted suicide rate (21.0 suicides per 100,000) among racial/ethnic groups, followed by American Indians (13.9/100,000), Black or African Americans (9.0/100,000), Hispanics (8.3/100,000), and Asians (7.0/100,000; **Figure 2B-23, Table 2B-4**).

The age-adjusted mortality rates for suicide varied in Arizona in 2014 from 7.1 suicides per 100,000 residents of Santa Cruz County to 32.5 suicides per 100,000 residents of Apache County (**Table 5E-11**).

Note: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

---

## 2B. LEADING CAUSES OF DEATH

### Chronic liver disease and cirrhosis

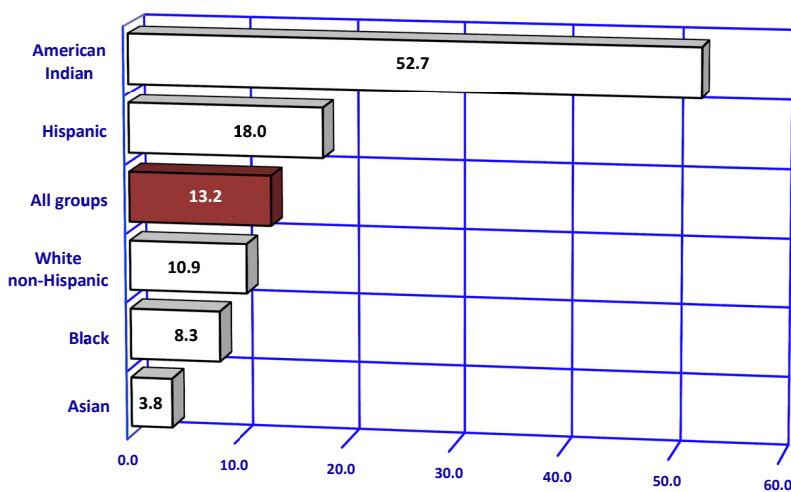

---

**Figure 2B-24**  
**Age-adjusted Mortality Rates<sup>a</sup> for Chronic Liver Disease and Cirrhosis  
 by Gender and Year, Arizona, 2004-2014**

Note: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

**Figure 2B-25**  
**Age-adjusted Mortality Rates<sup>a</sup> for Chronic Liver Disease and Cirrhosis  
 by Race/Ethnicity, Arizona, 2014**

Note: <sup>a</sup> Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

Chronic liver disease and cirrhosis was the 9<sup>th</sup> leading cause of death in Arizona in 2014 (**Figure 2B-1, Table 2B-1**). Among the 984 deaths due to chronic liver disease and cirrhosis, 590 (60.0 percent) were males (**Table 2B-4**).

Among females, the age-adjusted mortality rate for chronic liver disease and cirrhosis slightly decreased 9.0 percent from 2013 to 2014. Among males, the mortality rate decreased 9.3 percent from 18.2/100,000 in 2013 to 16.5/100,000 in 2014 (**Figure 2B-24, Table 2B-3**).

In 2014, Gila, Apache, La Paz, Navajo, Yavapai, and Mohave, and counties had the highest mortality rates for chronic liver disease and cirrhosis (**Table 5E-11**).

The 2014 death rate for chronic liver disease and cirrhosis among American Indians (52.7 deaths per 100,000) was 4.0 times greater than the state average (13.2/100,000; **Figure 2B-25, Table 2B-4**). The rate for Hispanics (18.0 deaths per 100,000 population) was the second highest among racial/ethnic groups in the State.

Compared to the median age at death from all causes (76 years), those who died from chronic liver disease and cirrhosis were on average 17 years younger (59 years, **Table 2D-3**). In 2014, the median age at death of American Indians who died from chronic liver disease and cirrhosis was only 52 years (**Table 2D-3**).

Notes: The cause-of-death titles are according to the Tenth Revision of the International Classification of Diseases (ICD-10). The causes of death for 2004-2014 are classified by ICD-10, replacing the Ninth Revision (ICD-9) used during 1979-1999. The group titles, such as cardiovascular diseases, infectious and parasitic diseases, or other cardiovascular diseases are not ranked to determine the leading causes of death. The ICD-10 code for the underlying cause of death was missing for as many as 140 in 2008.

Notes: <sup>a</sup> Adjusted to the 2000 standard U.S. population; <sup>b</sup> Chronic obstructive pulmonary diseases in 1980 and 1990; beginning in 2000, when the new standard for the age-adjustment of mortality rates was implemented, all previously published rates for 1979-1999 became obsolete. With the 2008 edition of this report we have added the recomputed age-adjusted mortality rates for 1991-1999. In order to compute these rates, we have used the population denominators consistent with both the 1990 and 2000 census. The mortality rates for 1989-1999 in Table 2B-2 also were revised for consistency; The denominators are available at:

<http://www.azdhs.gov/plan/>

## 2C.

### AGE-SPECIFIC MORTALITY

---

Six age-specific profiles of mortality are given on the following pages. The six developmental periods in the life span are:

- **Infants** less than one year of age
- **Children** 1 to 14 years old
- **Adolescents** or persons 15 to 19 years old
- **Young adults** or persons 20 to 44 years old
- **Middle-aged adults** or persons 45 to 64 years old
- **Elderly** or persons 65 years or older.

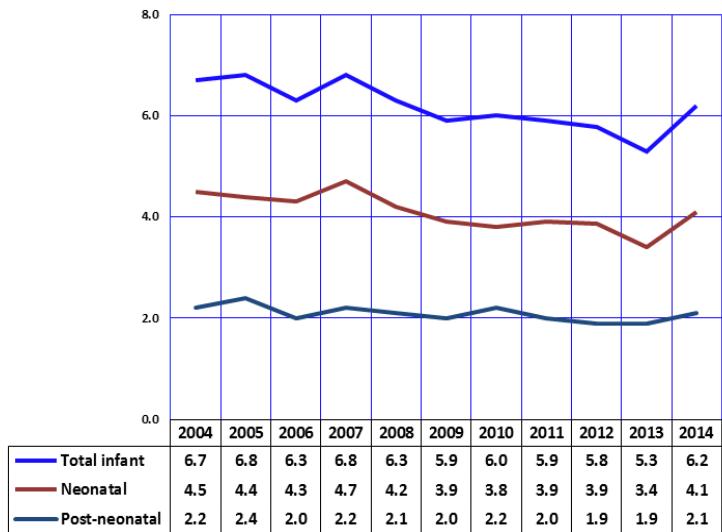

For each age group, cause-specific mortality is compared between urban (i.e., Maricopa, Pima, Pinal, and Yuma counties) and rural (all other counties) regions and between genders. Urban and rural regions also are compared in gender-specific total mortality.

A comparison of age-specific mortality for causes of death is provided in **Table 2C-27**. A comparison of age-specific mortality rates is in **Table 2C-28**.

## 2C. AGE-SPECIFIC MORTALITY

### Infant mortality

**Figure 2C-1**  
**Infant Mortality Rates by Neonatal/Postneonatal Age and Year,**  
**Arizona, 2004-2014**

Notes: Neonatal deaths are those infants age 0-27 days; Post-neonatal are deaths to infants age 28 days-1 year.

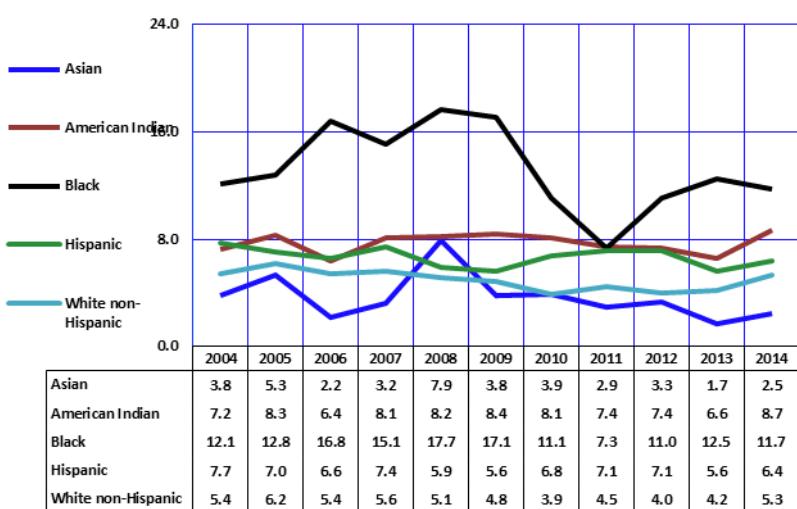

Infant mortality is defined as the number of deaths within the first year of life. The infant mortality rate is computed as the number of infant deaths in a calendar year per 1,000 live births recorded for the same period.

In 2014, 535 Arizona infants died before reaching their first birthday, 166 fewer than the latest peak of 701 infant deaths in 2007, but 88 more than 2013. (**Table 2C-2**).

Even if the infant mortality rate remained the same as it was in 2007, 109 fewer infant deaths can be attributed to the absolute reduction in the number births by 16,039 from 2007 to 2014  $((16,039 \times 6.8)/1,000) = 109$ .

The infant mortality increased to 6.2/1,000 in 2014, which was 17.0 percent higher than the rate in 2013 (5.3/1,000) and the highest rate since 2009. (**Figure 2C-1**). This may be attributed in part to the increase in the number of infant deaths in 2014, but also to the adjustment of the 2014 population estimate of children under 1 year old, given the overestimation of this population between 2011 and 2013.

**Figure 2C-2**  
**Infant Mortality Rates<sup>a</sup> by Race/Ethnicity and Year,**  
**Arizona, 2004-2014**

Note: <sup>a</sup> Number of infant deaths per 1,000 live births in specified group.

In 2014, 92.0 percent (491/535)\* of all infant death records were successfully matched to their corresponding birth records.

The mortality risk for infants varies by race/ethnicity. Infants of Asian or Pacific Islander mothers, followed by infants of White non-Hispanic mothers had the lowest infant mortality rates among the racial/ethnic groups in 2014 (**Figure 2C-2, Table 2C-2**).

In 2014, Black or African American infants had the worst survival chances among the ethnic groups (**Figure 2C-2**). American Indian and Hispanic or Latino infants also had elevated mortality rates.

\*Infant death records that were not linked to their corresponding birth certificates include unrecorded home births (i.e., no birth certificate was issued) and out-of-State births (i.e., the State issuing the certificate of birth did not send a copy to Arizona).

## 2C. AGE-SPECIFIC MORTALITY

### Infant mortality

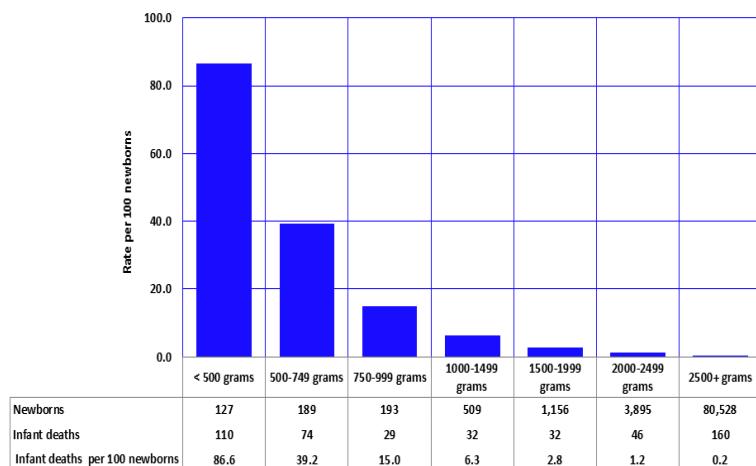

---

Newborn weight at birth is one of the most important predictors of an infant's survival chances. In 2014, the mortality rate among babies weighing less than 500 grams at birth was 86.6 percent (**Figure 2C-3**).

The absolute number of low birthweight births actually declined for the sixth consecutive year from 7,285 in 2007 to 6,069 in 2014. In 2014 the proportion of babies whose weight at birth was less than 1,000 grams increased from 7.4 percent of all low birthweight births in 2013 to 8.4 percent (**Table 1B-3**).

Together, infants weighing less than 1,500 grams accounted for 1.2 percent of births, and 49.9 percent of all infant deaths with a matching birth record.

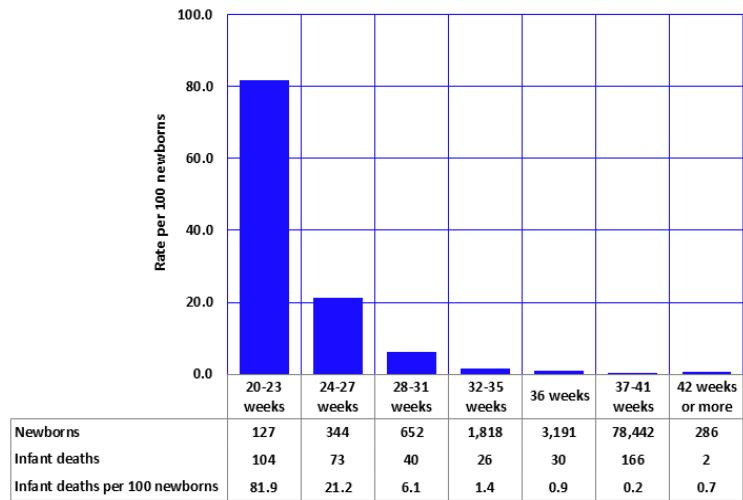

**Figure 2C-3**  
**Proportion of Infant Deaths by Birthweight, Arizona, 2014**

Note: 51 cases in the complete 2014 birth file had missing birthweight estimates.

As with low birthweight, preterm and very preterm infants have a large impact on the total infant mortality rate because of their much higher risk of infant mortality. For example, births at 27 weeks or less of gestation accounted for only 0.5 percent of all births but 36.0 percent of infant deaths with a matching death record. Births at less than 24 weeks of gestation have a very high infant mortality rate of 81.9 percent (**Figure 2C-4**). Overall, preterm infants (those born at less than 37 weeks of gestation) accounted for 7.1 percent of all births (**Table 1B-26**) and 55.6 percent of all infant deaths (only those with matching death records).

**Figure 2C-4**  
**Proportion of Infant Deaths by Gestational Age, Arizona, 2014**

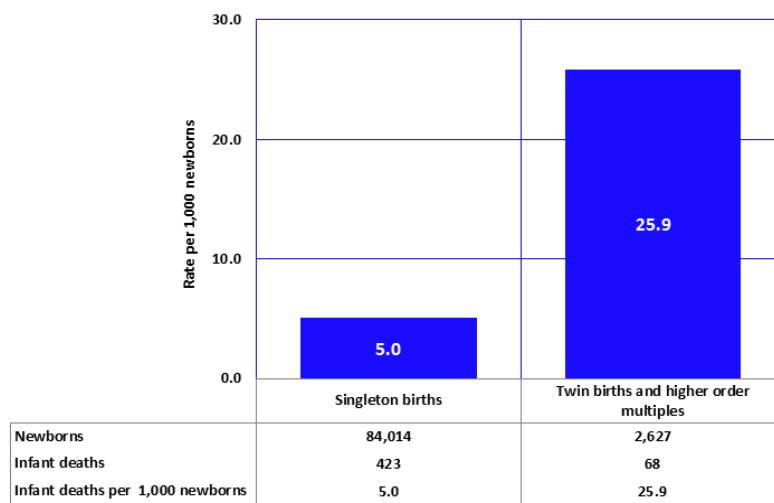

Note: 148 cases in the complete 2014 birth file had missing gestational age estimates, 50 of which were missing in the linked infant death file.

## 2C. AGE-SPECIFIC MORTALITY

### Infant mortality

---

**Figure 2C-4.2**  
**Infant Mortality Rates for Single and Multiple Births, Arizona, 2014**

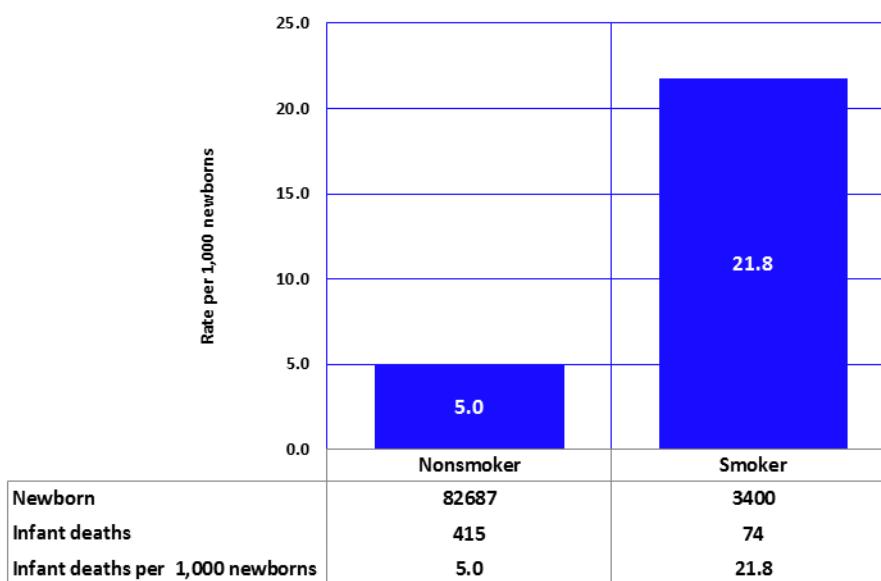

Note: 7 cases in the complete 2014 birth file was missing plurality.

As already noted in Section 1B, infants born in multiple deliveries tend to be born at shorter gestations and smaller than those in singleton deliveries. In 2014, infants born in multiple deliveries were 12.7 times more likely (45.6 vs. 3.6 percent) to be born earlier than expected (at less than 37 completed weeks of gestation) and smaller (at less than 2,500 grams) than singleton births (**Figure 1B-10**).

The infant mortality rate for single births was 5.0 in 2014 (**Figure 2C-4.2**). The infant mortality rate for twin births or higher order multiples was 25.9.

Babies born in multiple deliveries accounted for 3.0 percent of births (**Table 1B-16**), but 13.8 percent of all infant deaths in Arizona in 2014 (only those with matching birth and death records).

**Figure 2C-4.3**  
**Infant Mortality Rates by Mother's Smoking Status during Pregnancy, Arizona, 2014**

Smoking during pregnancy has been shown to increase the risk of preterm delivery, low birth weight and infant mortality. In 2014, among the 3,400 mothers who smoke during pregnancy, the risk of infant mortality was 4.4 times higher than among nonsmoker mothers (**Figure 2C-4.3**).

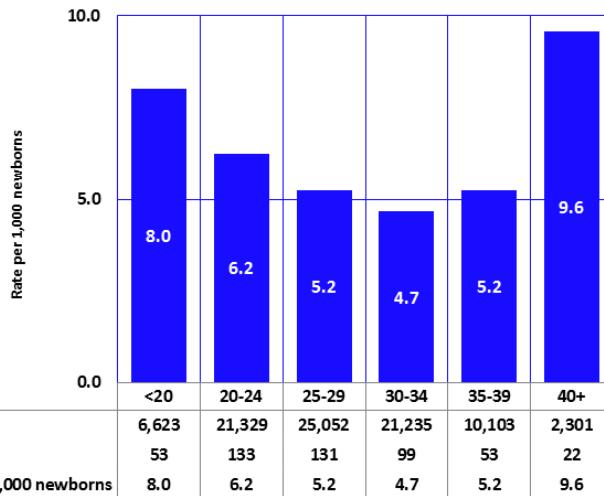

Note: 468 cases in the complete 2014 birth file were missing mothers' smoking status.

## 2C. AGE-SPECIFIC MORTALITY

### Infant mortality

---

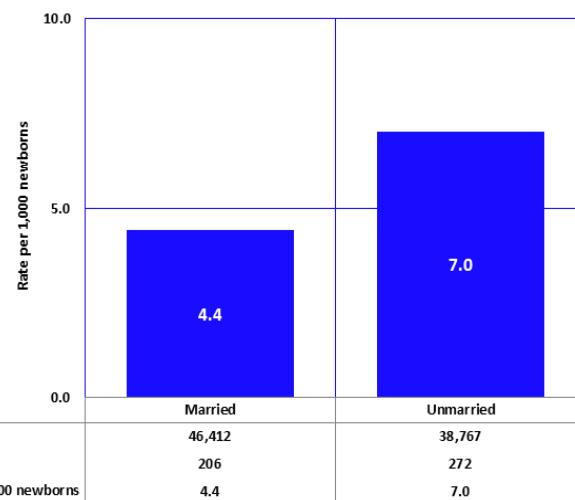

**Figure 2C-4.4**  
**Infant Mortality Rates by Mother's Age Group, Arizona, 2014**

Note: 5 cases in the complete 2014 birth file were missing mother's age.

Infants born to unmarried mothers accounted for the absolute majority of infant deaths in 2014 (272 vs. 206). The number of births to married mothers exceeded by 19.7 percent the number of births to unmarried mothers (46,412 vs. 38,767; **Table 1B-25**). In 2014, infants of unmarried mothers had an infant mortality rate of 7.0 deaths per 1,000 live births, 1.6 times higher than the rate for infants of married mothers (4.4 infant deaths per 1,000 live births; **Figure 2C-4.5**). The effect of marital status on infant mortality suggests that marital status is a proxy measure of factors traditionally related to infant mortality such as poverty conditions, access to health care and social support. Mother's marital status may signify the presence or absence of emotional, social, and financial resources.

**Figure 2C-4.5**  
**Infant Mortality Rates by Mother's Marital Status, Arizona, 2014**

Note: 1,469 cases in the complete 2014 birth file were missing mother's marital status.

## 2C.AGE-SPECIFIC MORTALITY Childhood mortality (ages 1-14 years)

**Figure 2C-5**  
**Mortality Rates<sup>a</sup> by Gender and Year among Children 1-14 Years,  
Arizona, 2004-2014**

Note: <sup>a</sup> Number of deaths per 100,000 persons, 1-14 years old in specified group.

**Figure 2C-6**  
**Mortality Rates<sup>a</sup> by Race/Ethnicity among Children 1-14 Years,  
Arizona, 2014**

Note: <sup>a</sup> Number of deaths per 100,000 persons, 1-14 years old in specified group.

In 2014, a total of 227 deaths were recorded among 1,271,484 children aged 1-14 years residing in Arizona. The 2014 childhood mortality rate of 17.9 per 100,000 was 9.7 percent lower than the 2013 mortality rate of 19.8 (**Table 2C-7**). The mortality rate declined for male children but increased slightly for female children from 2013 to 2014. (**Figure 2C-5, Table 2C-7**).

The five causes with the greatest mortality rates in childhood from 2004-2014 were *accidents (unintentional injuries)*, *malignant neoplasms*, *congenital malformations*, *homicide*, and *suicide* (**Table 2C-7**).

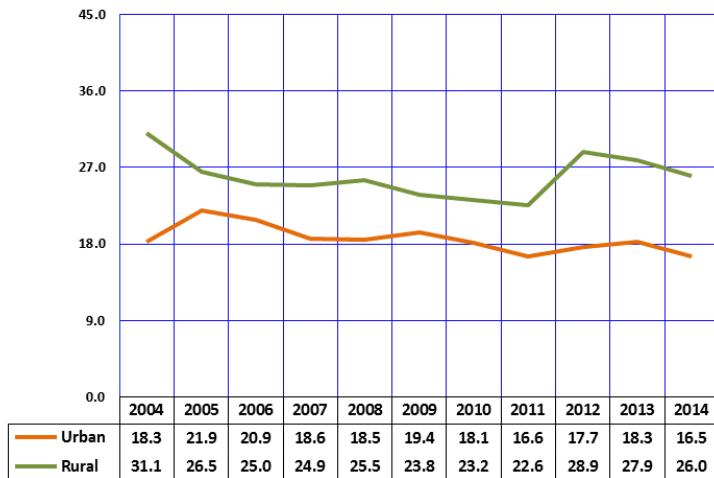

American Indian children had the highest 2014 total mortality rate (28.8 deaths per 100,000) followed by Black or African American children (21.7/100,000; **Figure 2C-6**). The mortality rates of Asian, White non-Hispanic, and Hispanic or Latino children were lower than the average rate for all groups.

In 2014, there were approximately 20 children who died of accidental drowning and submersion, around 10 children who died of assault, and 10 completed *suicides* of children aged 1-14 years (**Table 2C-10**). The mortality rate for Native American children due to automobile accidents was 11.1 times greater than the automobile accident mortality rate for White non-Hispanic children.

**2C.AGE-SPECIFIC MORTALITY**  
**Childhood mortality (ages 1-14 years)**

---

**Figure 2C-7**  
**Mortality Rates<sup>a</sup> by Urban/Rural Area<sup>b</sup> and Year among Children 1-14 Years,  
Arizona, 2004-2014**

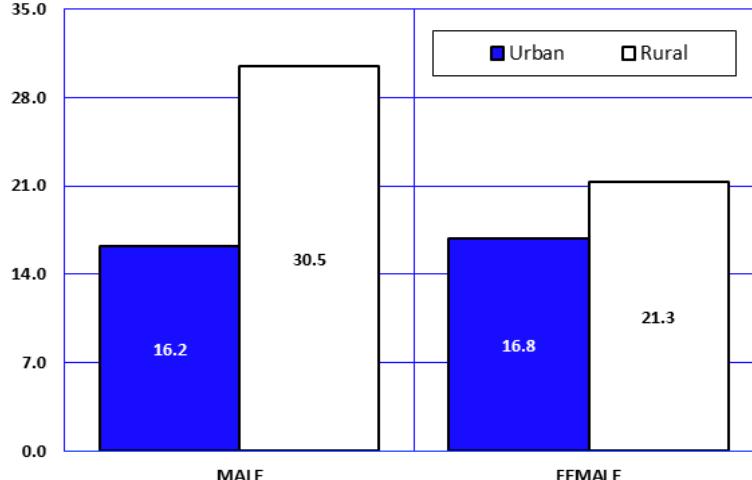

From 2013 to 2014, overall mortality rates decreased for both urban and rural children (**Figure 2C-7, Table 2C-8**). From 2004 to 2014 the total mortality rates decreased by 9.8 percent for urban children and by 16.4 percent for rural children.

Notes: <sup>a</sup> Number of deaths per 100,000 persons, 1-14 years old in specified group; <sup>b</sup> Urban counties are Maricopa, Pima, Pinal, and Yuma Counties, Rural Counties are those remaining.

**Figure 2C-8**  
**Mortality Rates<sup>a</sup> by Gender in Urban/Rural<sup>b</sup> Areas among Children 1-14 Years,  
Arizona, 2014**

From 2013 to 2014, the mortality rate for accidents decreased for both urban and rural children (**Table 2C-8**). The mortality rate for unintentional injuries among rural children (8.9/100,000) was 2.0 times greater than the rate among urban children (4.5/100,000, **Table 2C-8**). In 2014, 15 children in urban areas died of accidental drowning while fewer rural children died of this cause (**Table 2C-10**).

Urban males aged 1-14 years old had the lowest mortality risk among gender by area groups in 2014, followed by urban females, rural females, and rural males.

Notes: <sup>a</sup> Number of deaths per 100,000 persons, 1-14 years old in specified group; <sup>b</sup> Urban counties include Maricopa, Pima, Pinal, and Yuma Counties, Rural Counties are those remaining.

Notes: \* Cell suppressed due to count less than 6; † Sum rounded to nearest tens unit due to addend less than 6;<sup>a</sup> May include death records where the county of residence could not be classified as urban or rural; <sup>b</sup> Urban = Maricopa, Pima, Pinal, and Yuma counties; the remaining counties comprise Arizona's rural areas;<sup>c</sup> May include other causes of death not shown above.

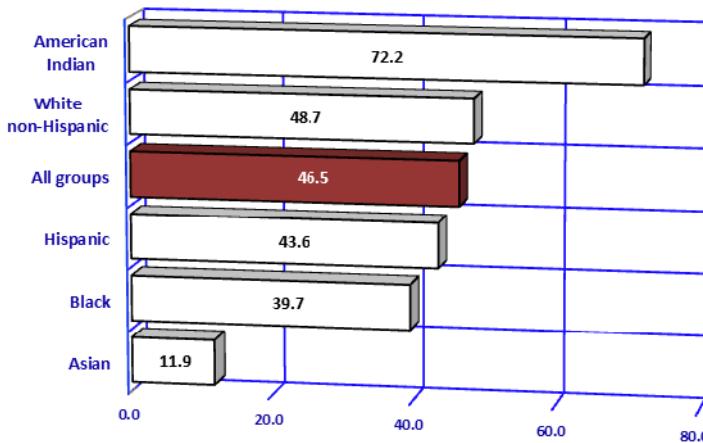

## 2C.AGE-SPECIFIC MORTALITY Adolescent mortality (ages 15-19 years)

**Figure 2C-9**  
**Mortality Rates<sup>a</sup> by Gender and Year among Adolescents 15-19 Years,  
Arizona, 2004-2014**

Note: <sup>a</sup> Number of deaths per 100,000 persons, 15 - 19 years old in specified group.

**Figure 2C-10**  
**Mortality Rates<sup>a</sup> by Race/Ethnicity among Adolescents 15-19 Years,  
Arizona, 2014**

Note: <sup>a</sup> Number of deaths per 100,000 persons, 15 - 19 years old in specified group.

Adolescence refers to individuals between the ages of 15 and 19, an important developmental period marking the transition from childhood to adulthood. In 2014, an estimated 453,593 adolescents resided in Arizona, comprising 6.8 percent of the State's population (**Table 10A-1**). The lives of 211 resident adolescents prematurely ended in 2014, resulting in a total mortality rate of 46.5 deaths per 100,000 adolescents. This mortality rate was 42.5 percent lower than the 2004 rate (**Table 2C-11**).

The likelihood of dying was 2.3 times greater for adolescent boys than for adolescent girls in 2014 (**Figure 2C-9, Table 2C-11**).

The five causes with the greatest number of deaths over the 2004-2014 period were *unintentional injuries in accidents, suicide, homicide malignant neoplasms, and symptoms, signs, and abnormal findings* (**Table 2C-14**).

In 2014, adolescents who were Asian, Black, or Hispanic had greater survival chances than the state average for all adolescents, while American Indian and White non-Hispanic adolescents had lower survival chances than average (**Figure 2C-10**). If the 2014 mortality risk of Asian adolescents (i.e., their mortality rate) applied to all adolescents, only 157 would have died: 54 less than the 211 who actually did.

The number of deaths from accidental drug poisoning declined from 30 in 2013 to less than 15 in 2014.

## 2C.AGE-SPECIFIC MORTALITY

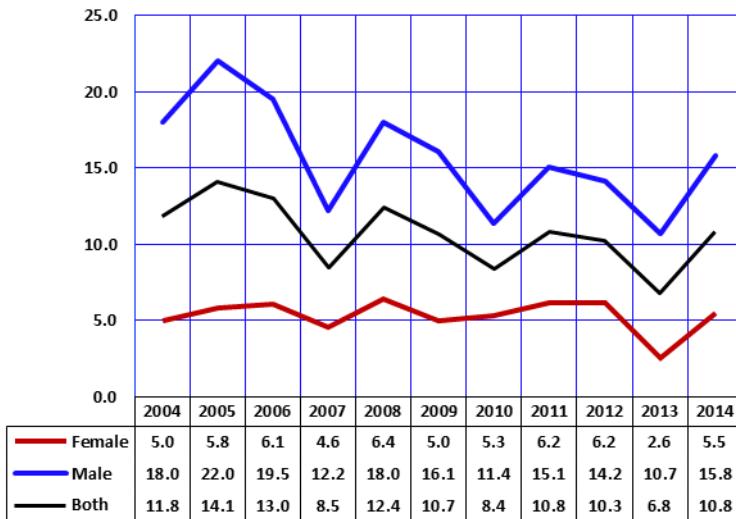

### Adolescent mortality (ages 15-19 years)

---

The number of suicides among Arizonans age 15-19 years increased 53.1 percent from 2013 (n = 32) to 2014 (n = 49; **Table 2C-14**). In 2013, as in prior years, male adolescents accounted for the absolute majority (75.5 percent) of completed suicides.

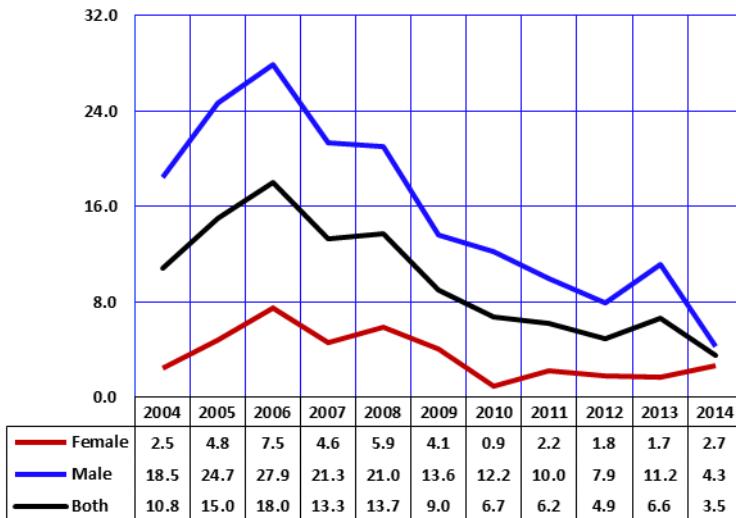

The suicide rate in 2013 was the lowest recorded since at least 1990 (**Figure 2C-11, Table 2C-11**). In 2014, the adolescent male suicide rate was 12.0 percent lower, and the adolescent female suicide rate was 9.0 percent higher, than in 2004, respectively. The male to female ratio in suicide mortality rates decreased from 3.6:1 in 2004 to 2.9:1 in 2014. In other words, male adolescents were 2.9 times more likely to kill themselves in 2014 than female adolescents, compared to 3.6 times more likely in 2004.

**Figure 2C-11**  
**Suicide Rates<sup>a</sup> by Gender and Year among Adolescents 15-19 Years, Arizona, 2004-2014**

## 2C.AGE-SPECIFIC MORTALITY

### Young adult mortality (ages 20-44 years)

---

**Figure 2C-13**  
**Mortality Rates<sup>a</sup> by Gender and Year among Young Adults 20-44 Years,  
Arizona, 2004-2014**

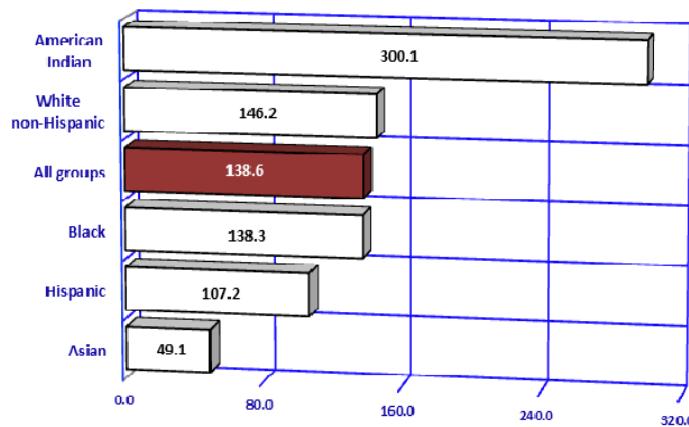

In 2014, 33.1 percent of Arizona residents were between 20 and 44 years of age. Among the six developmental periods examined in the life span, young adulthood, with an estimated 2.2 million individuals, easily represented the largest segment of the population. However, only 6.0 percent of all deaths occurred during young adulthood.

The number of deaths among young adults rose less than 2 percent from 2004 to 2014. Compared to 2013, the young adult mortality rate decreased for both male and female, but more so among young adult females (5.9 percent) than young adult males (2.2 percent). (**Figure 2C-13, Table 2C-15**).

Note: <sup>a</sup> Number of deaths per 100,000 persons, 20-44 years old in specified group.

---

**Figure 2C-14**  
**Mortality Rates<sup>a</sup> by Race/Ethnicity among Young Adults 20-44 Years,  
Arizona, 2014**

The rank order of survival chances of young adults from best to worse by race/ethnicity in 2014 was Asian, Hispanic or Latino, Black or African American, White non-Hispanic and American Indian. American Indian young adults had a mortality rate 2.1 times greater than White non-Hispanic adults, the racial/ethnic group with the second highest young adult mortality rate. The American Indian young adult mortality rate was 2.2 times greater than the state average for young adults and 6.1 times greater than Asian young adults.

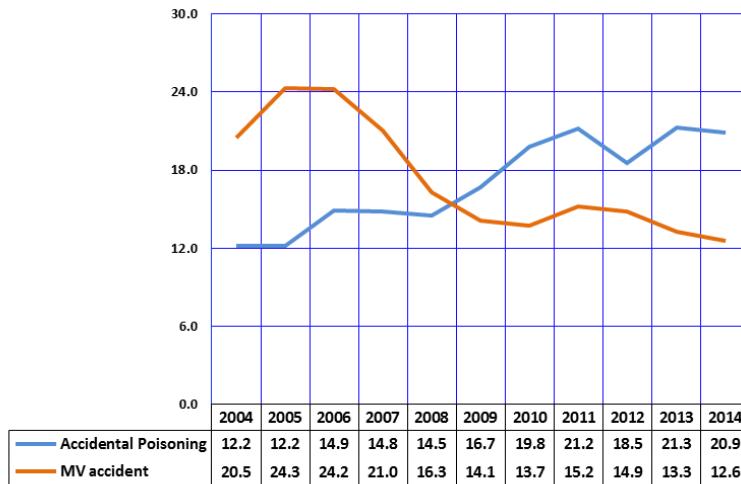

Note: <sup>a</sup> Number of deaths per 100,000 persons, 20-44 years old in specified group.

---

## 2C.AGE-SPECIFIC MORTALITY Young adult mortality (ages 20-44 years)

In 2014, 462 deaths of young adults were attributed to accidental poisoning (**Table 2C-18**), compared to roughly slightly the same number of deaths in 2013. The mortality rate for accidental poisoning among young adults (20.9/100,000) exceeded the mortality rate for motor vehicle-related injuries for the sixth straight year (**Figure 2C-15**). Among the young adults 20-44 years, 413 of the 462 accidental poisoning were due to drug overdose (ICD10 X40-44) and 38 were due to alcohol poisoning (ICD10 X45).

**Figure 2C-15**  
**Mortality Rates<sup>a</sup> for Motor Vehicle-Related Injuries and Accidental Poisoning by Year among Young Adults 20-44 Years, Arizona, 2004-2014**

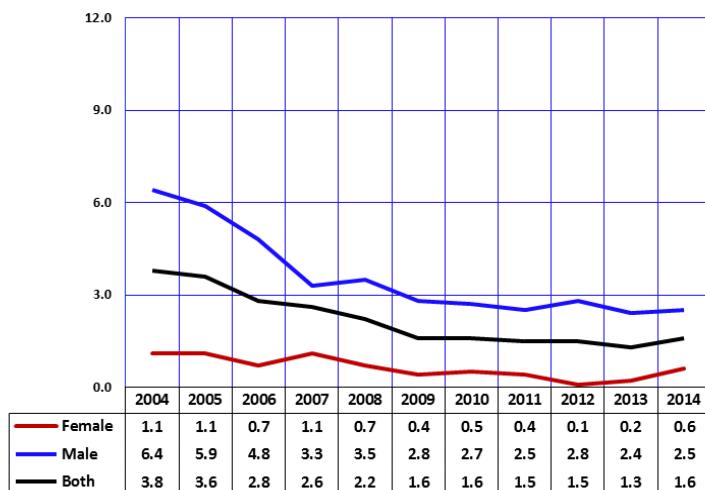

Note: <sup>a</sup> Number of motor vehicle and accidental poisoning deaths per 100,000 persons, 20-44 years old in specified group.

In 2014, more Arizonans 20-44 years old died from the *human immunodeficiency virus (HIV)* disease than from *morbid obesity* (**Table 2C-18**).

Of the 104 deaths from *HIV disease* in 2014, about 34 percent occurred among Arizonans 20-44 years old (**Table 2C-27**). Males accounted for 80.0 percent of young adult deaths from *HIV disease* in 2014 (**Table 2C-18**).

The mortality rate for *HIV disease* among young male adults increased 4.2 percent from 2.4/100,000 adults 20-44 years in 2013 to 2.5/100,000 in 2014.

**Figure 2C-16**  
**Mortality Rates<sup>a</sup> for HIV Disease by Gender and Year among Young Adults 20-44 Years, Arizona, 2004-2014**

Note: <sup>a</sup> Number of HIV deaths per 100,000 persons, 20-44 years old in specified group.

## 2C.AGE-SPECIFIC MORTALITY

### Middle-aged adult mortality (ages 45-64 years)

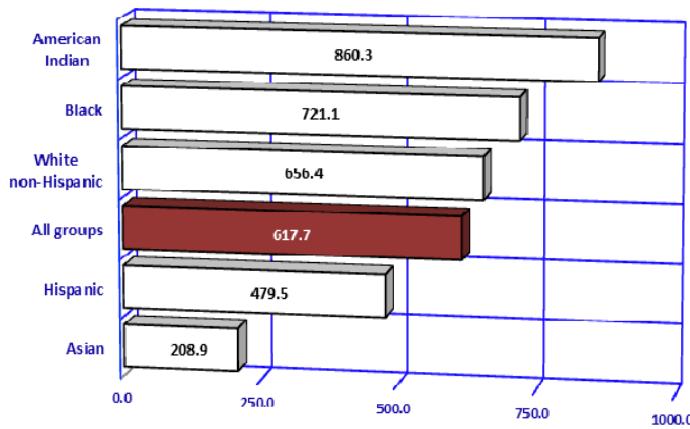

---

**Figure 2C-17**  
**Mortality Rates<sup>a</sup> by Gender and Year among Middle-Aged Adults 45-64 Years, Arizona, 2004-2014**

Note: <sup>a</sup> Number of deaths per 100,000 persons, 20-44 years old in specified group.

**Figure 2C-18**  
**Mortality Rates<sup>a</sup> by Race/Ethnicity among Middle-Aged Adults 45-64 Years, Arizona, 2014**

Note: <sup>a</sup> Number of deaths per 100,000 persons, 20-44 years old in specified group.

In 2014, the 1,622,954 middle-aged adult residents aged 45 to 64 experienced 10,025 deaths, or an average of 27 deaths, per day. The total number of deaths among 45 - 64 year old Arizona residents was higher in 2014 than any year since 1980, and is likely the greatest number of deaths among this age group in Arizona's history (**Table 2C-19**).

The 2014 total mortality rate among middle-age females was 2.9 percent lower, and among middle-aged males 5.9 percent lower than their respective rates in 2004 (**Figure 2C-17, Table 2C-19**). In 2014, the mortality rate for males age 45 - 64 was 65.3 percent greater than for females of the same age group.

The five causes with the greatest number of deaths in 2004-2014 were *malignant neoplasms*, *diseases of heart*, *accidents*, *chronic liver disease and cirrhosis*, and *chronic lower respiratory diseases* (**Table 2C-19**).

American Indian, Black or African American, and White non-Hispanic middle-aged adults had the three highest mortality rates (860.3/100,000, 721.1/100,000, and 656.4/100,000, respectively) among the racial/ethnic groups.

If the 2014 total mortality rate for Asian middle-aged adults applied to all Arizona residents 45-64 years old, 3,390 middle-aged adults would have died rather than the 10,025 who actually did.

## 2C.AGE-SPECIFIC MORTALITY

### Middle-aged adult mortality (ages 45-64 years)

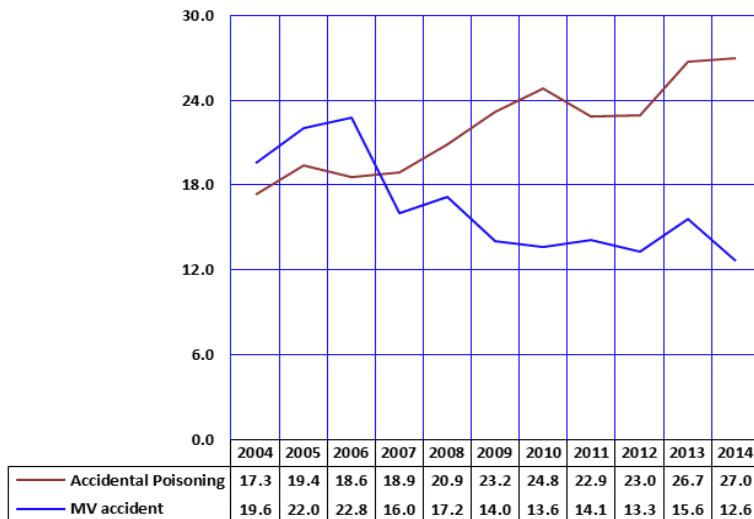

---

In recent years, middle-aged adults experienced an unprecedented increase in mortality from accidental poisoning. The 2014 mortality rates due to accidental poisoning was 27.0 per 100,000 adults aged 45-65 years, an increase of 1.1 percent from 2013. In 2014, about 440 deaths were attributed to accidental poisoning (**Table 2C-22**), compared to 267 deaths in 2004. Of the accidental poisoning deaths in this age group, 406 were drug overdoses (ICD10 X40-X44) and 28 were alcohol poisoning (ICD10 X45).

Beginning in 2007, the mortality rate for accidental poisoning exceeded the mortality rate for motor vehicle-related injuries among the middle-aged (**Figure 2C-19**). In 2014, accidental poisoning mortality rate of 27.0 per 100,000 middle-aged adults was 2.14 times fold higher than the mortality rate of 12.6 per 100,000 for motor vehicle accidents. White non-Hispanics accounted for about 79 percent of all accidental poisoning deaths (**Table 2C-22**).

---

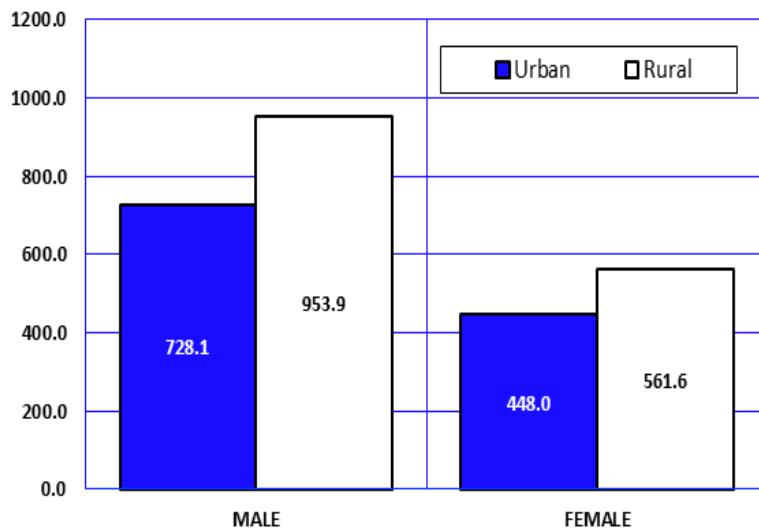

**Figure 2C-19**  
**Mortality Rates<sup>a</sup> for Accidental Poisoning and Motor Vehicle-related Injuries by Year among Middle-Aged Adults 45-64 Years, Arizona, 2004-2014**

Note: <sup>a</sup> Number of motor vehicle and accidental poisoning deaths per 100,000 persons, 20-44 years old in specified group.

In 2014, as in the past, rural middle-aged males had the poorest survival chances (**Figure 2C-20, Table 2C-21**). The mortality rate for rural middle-aged males in 2014 was 31.0 percent greater than for urban males, 69.9 percent greater than rural females, and 112.9 percent (1.6 times) greater than urban females.

**Figure 2C-20**  
**Mortality Rates by Gender in Urban<sup>a</sup> and Rural Areas among Middle-Aged Adults 45-64 Years, Arizona, 2014**

Note: <sup>a</sup> Urban counties include Maricopa, Pima, Pinal, and Yuma counties.

## 2C.AGE-SPECIFIC MORTALITY

### Elderly mortality (ages 65 years and older)

---

**Figure 2C-21**  
**Mortality Rates<sup>a</sup> by Gender and Year among Elderly 65 Years and Older,  
 Arizona, 2004-2014**

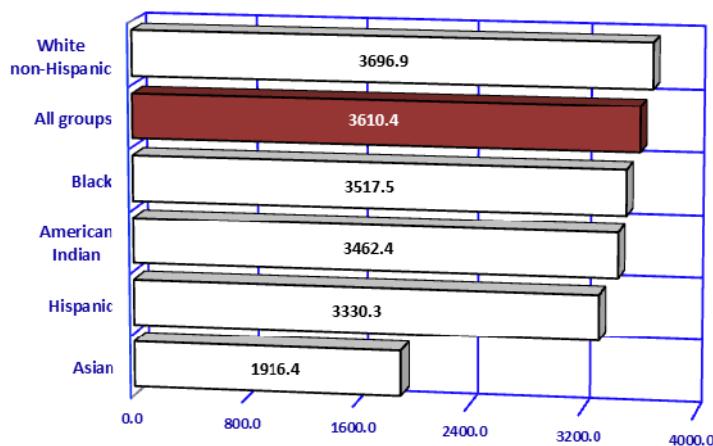

Note: <sup>a</sup> Number of deaths per 100,000 persons, 65+ years old in specified group.

In 2014, an estimated 1,025,105 residents age 65 years and older resided in the State (**Table 10A-1**). No other age group has as great a disproportionate gender distribution as the elderly. As a result of the higher total mortality rates for males at earlier ages, 15.0 percent more elderly women than men were alive in 2014.

The 2014 elderly mortality rate of 3,610.4 per 100,000 was 10.6 percent lower than the 2004 rate of 4,038.0 and was the lowest mortality rate among the elderly since 1980, and likely the lowest mortality rate amongst this age group in Arizona's record (**Table 2C-23**).

The 2014 total mortality rate among elderly females was 11.0 percent lower than their rate in 2004. The mortality rate among elderly males decreased 10.5 percent during the same period (**Figure 2C-21, Table 2C-23**).

**Figure 2C-22**  
**Mortality Rates<sup>a</sup> by Race/Ethnicity among Elderly 65 Years and Older,  
 Arizona, 2014**

In 2014 the mortality rate for Arizona's White non-Hispanic elderly residents was about 2 times that of the Asian elderly population. The mortality rate of 1,916.4 /100,000 among elderly Asians was the lowest rate among the racial/ethnic groups (**Figure 2C-22**). Hispanic or Latino elderly had the second lowest mortality rate in 2014 at 3,330.3/100,000.

Note: <sup>a</sup> Number of deaths per 100,000 persons, 65+ years old in specified group.

**2C.AGE-SPECIFIC MORTALITY**  
**Elderly mortality (ages 65 years and older)**

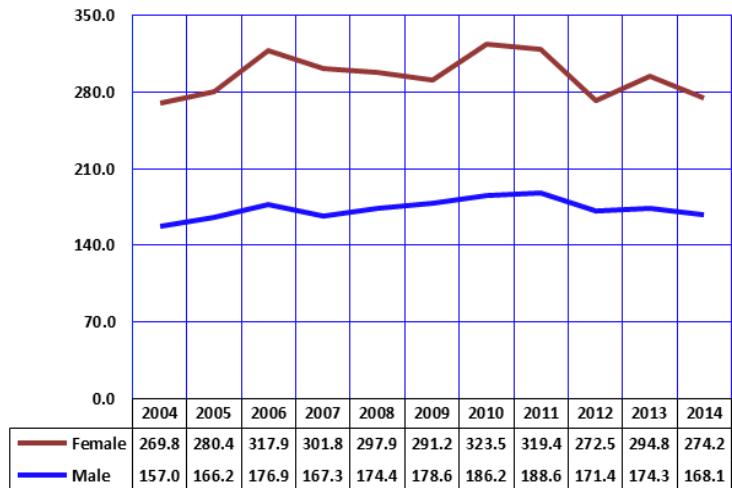

---

**Tables 2C-23 and 2C-24** provide mortality rates for the five causes with the greatest number of deaths over the 2004 – 2014 period.

In 2014, Alzheimer's disease (2,311deaths; **Table 2C-26**) accounted for 6.2 percent of elderly mortality. From 2013 to 2014, gender-specific death rates for Alzheimer's disease decreased for both elderly males and elderly females (**Figure 2C-23**).

There were 1,519 deaths from Alzheimer's disease among elderly females in 2014, almost twice the number of deaths from this cause among males (792; **Table 2C-26**). White non-Hispanic elderly accounted for 85.1 percent of the 2014 deaths from Alzheimer's disease (based on data in **Table 2C-26**).

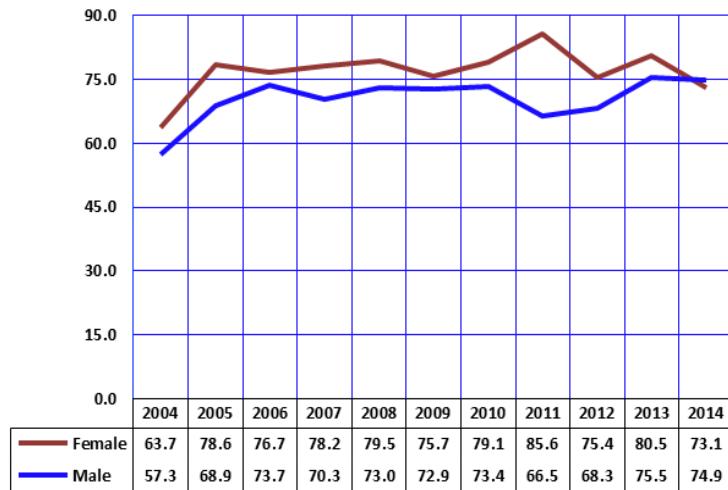

**Figure 2C-23**  
**Trends in Mortality Rates for Alzheimer's Disease<sup>a</sup> by Gender and Year**  
**among Elderly 65 Years and Older, Arizona, 2004-2014**

Note: <sup>a</sup> Number of deaths due to Alzheimer's disease per 100,000 persons, 65+ years old in specified group.

## 2D.

### PATTERNS OF PREMATURE MORTALITY

---

Compared with White non-Hispanics, the racial/ethnic minority groups in Arizona had greater percentages of people younger than 25 years in 2014 (46.0 vs. 26.14 percent). In contrast, people aged 65 years and older accounted for 21.9 percent of White non-Hispanics, but only 6.5 percent of all ethnic minority groups combined (percentages based on race-and-age-specific population denominators in **Table 10C-1**).

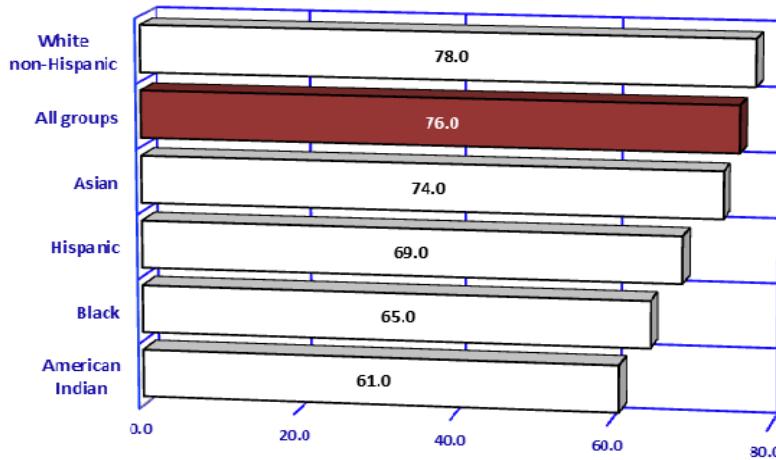

Arizona's population distribution by age and race/ethnicity is related to patterns of mortality among these subgroups. In 2014, of all deaths among the elderly (65 years and older), 84.1 percent were White non-Hispanics, 10.1 percent were Hispanic or Latino, with the three remaining racial/ethnic groups comprising only 5.7 percent of all deaths in this age group (**Table 2C-26**). Looking at younger ages, Native American children comprised only 7.7 percent of Arizona's population age 1 – 14, but accounted for 12.3 percent of all childhood deaths. Native American adolescents represented only 7.3 percent of all adolescents but accounted for 11.3 percent of all adolescent deaths. Finally, Native American young adults (ages 20 – 44) represented 6.4 percent of all young adults but comprised 13.9 percent of all young adult deaths. In summary, Arizona's racial/ethnic minority groups tend to experience mortality earlier in life than Arizona's White non-Hispanics.

Beginning with the 2005 edition of the report, information about the arithmetic mean age at death was supplemented with information about the median age, or the age in the center of the distribution when sorted by age (see **Table 2D-1**). The median age is higher than the arithmetic mean age in negatively skewed distributions.

## 2D. PATTERNS OF PREMATURE MORTALITY

---

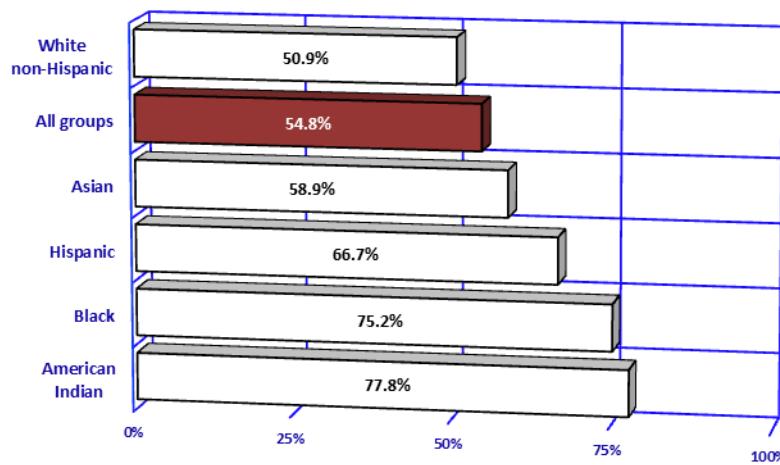

**Figure 2D-1**  
**Median Age at Death by Race/Ethnicity, Arizona, 2014**

The median age at death decreased from 77 years in 2013 to 76 years in 2014 (**Table 2D-1**). In other words, one of every two Arizonans who died in 2014 was older than 76 years of age. Among Arizona females, fifty percent were 80 years older when they died in 2014. Among males, the median age at death was 73 years in 2014. **Table 2D-1** shows both the median age at death by race/ethnicity and gender in 2004-2014.

In 2014, compared to White non-Hispanics, on average Asians were 4 years younger at time of death, Hispanics were 9 years younger, Blacks were 13 years younger, and American Indian residents of Arizona were 17 years younger (based on the median age at death).

**Figure 2D-2**  
**Percent of Deaths before Expected<sup>a</sup> Years of Life Reached by Race/Ethnicity, Arizona, 2014**

The percent of deaths before expected years of life reached (a premature death ratio) slightly decreased for all Arizonans from 54.6 in 2013 to 54.8 in 2014 (**Figure 2D-2**).

As expected, based on the findings for average and median age at death, White non-Hispanics were the only group with about 50 percent of all deaths (50.9 percent) occurring before the expected years of life were reached (**Figure 2D-2**). On average, 69.7 percent of the deaths among racial/ethnic minority groups occurred prematurely.

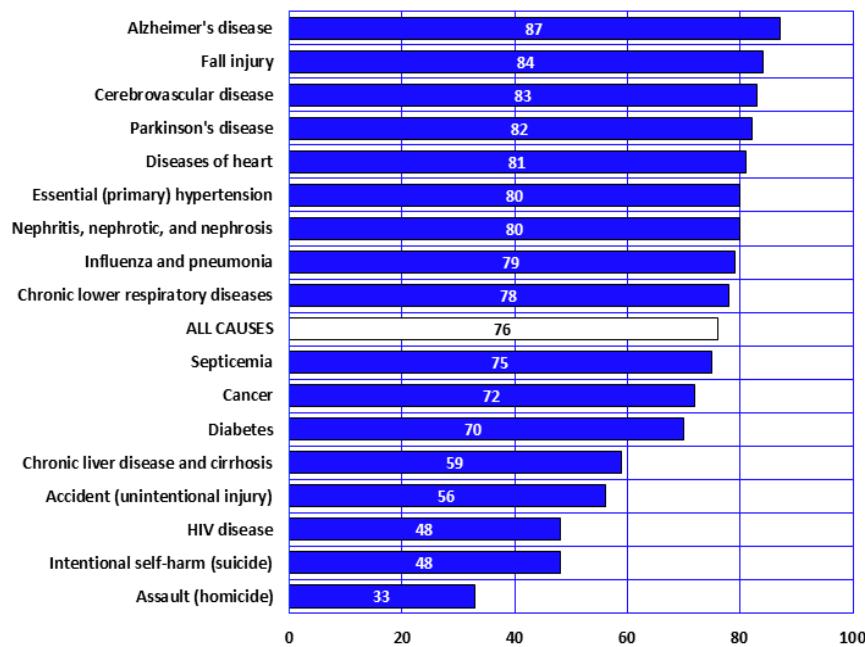

Among American Indians, nearly eight out of ten deaths (77.8 percent) were premature (**Table 2D-2**).

Note: <sup>a</sup> Expected years of life at birth for all U.S. residents (78.8 years).

## 2D. PATTERNS OF PREMATURE MORTALITY

---

**Figure 2D-3**  
**Median Age at Death for Selected Leading Causes of Death,  
 Arizona, 2014**

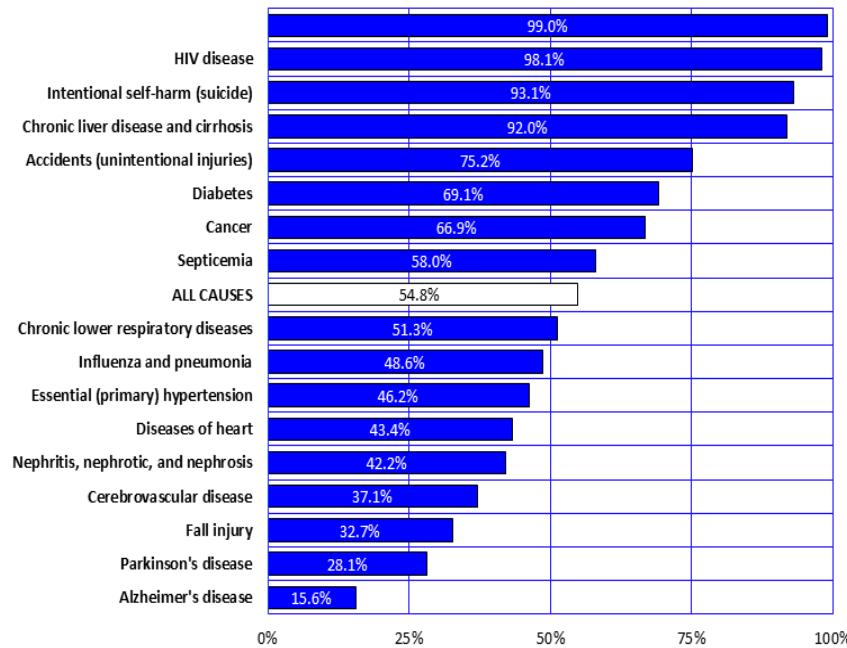

In 2014, *Alzheimer's disease* had the highest median age of death at 87 years (**Figure 2D-3**), exceeding by 11 years the median age at death for all causes (**Figure 2D-3, Table 2D-3**).

Among the leading causes of death, *homicide* had the lowest median age at death of 33 years.

From 2010-2014, *cancer* has replaced *diseases of the heart* as the leading cause of death (based on the number of deaths). This epidemiologic transition in mortality risks is likely to have long lasting implications for the life expectancy of Arizonans, because the median age at death from *cancer* (72 years) is substantially lower than the median age at death from *diseases of the heart* (81 years).

**Figure 2D-4**  
**Percent of Deaths before Expected Years of Life<sup>a</sup> Reached for  
 Selected Leading Causes of Death, Arizona, 2014**

Only 15.6 percent of deaths from *Alzheimer's disease* occurred before the age of 78.8 years, i.e., before the expected years of life were reached. In contrast, all deaths from *HIV disease* were premature (**Figure 2D-4, Table 2D-4**) and the median age at death from *HIV disease* decreased from the previous year at 48 years (**Figure 2D-3, Table 2D-3**).

A minority of deaths from *diseases of heart* were premature (43.4 percent). In contrast 66.9 percent of deaths from *cancer* occurred before the expected years of life were reached.

Note: <sup>a</sup> Expected years of life at birth for all U.S. residents (78.8 years).
