Infant mortality is defined as the number of deaths within the first year of life. The infant mortality rate (IMR) is computed as the number of infant deaths in a calendar year per 1,000 live births recorded for the same period. For consistency with the national data, the denominators to calculate infant mortality rates were changed from race/ethnicity of parents to race/ethnicity of mother.

In 2002, 552 infants died before reaching their first birthday for an infant mortality rate of 6.3 deaths per 1,000 live births. The 2002 infant mortality was the lowest recorded in Arizona since at least 1950 and represented a 24.1 percent reduction from the 1992 rate (Figure 2C-1, Table 2C-1, Table 8C-2).

The 2002 mortality risk for infants varied by race/ethnicity. Infants of Asian mothers, followed by babies of White non-Hispanic mothers had the lowest infant mortality rates among the ethnic groups in 2002 (Figure 2C-2, Table 2C-2).

In 2002, Black infants continued to have the worst survival chances among the ethnic groups, followed by American Indians (Figure 2C-2). The risk of dying among Black infants was 2 times greater than the risk for Hispanics and 3.3 times greater than the risk for Asians. American Indian infants were 1.75 times more likely to die before their first birthday (7 infant deaths per 1,000 live births) in 2002 than Asian infants, the group with lowest IMR of 4 deaths per 1,000 live births.
Infants of Asian mothers, followed by babies of American Indian and White non-Hispanic mothers had the lowest mortality rates in the neonatal period (from birth to 28 days of age, NMR), among the racial/ethnic groups in 2002 (Figure 2C-3, Table 2C-3).

Three out of every four (78.9 percent) neonatal deaths in Arizona in 2002 occurred during the first week of life (Table 5E-15).

The rate of postneonatal deaths (between 28 days and 365 days after birth, PNMR) for American Indian infants decreased from 6.6 deaths per 1,000 live births in 2001 to 3.4/1,000 in 2002 (Table 2C-3). Still, the American Indian PNMR was the second highest among the racial/ethnic groups in 2002, and it exceeded the PNMR for all groups by 221 percent (Figure 2C-4). The PNMR for infants of Asian decreased from 1.4/1,000 in 2001 to 0.9/1,000 in 2002 and was the lowest among racial/ethnic groups.
