

# **CHAPTER 3**

## **REPORTABLE DISEASES, ARIZONA, 2005-2015**

---

- 3A. NON-SEXUALLY TRANSMITTED DISEASES**
- 3B. SEXUALLY TRANSMITTED DISEASES**
- 3C. HUMAN IMMUNODEFICIENCY VIRUS (HIV)  
DISEASE AND ACQUIRED IMMUNODEFICIENCY  
SYNDROME (AIDS)**

### **3A.**

#### **NON-SEXUALLY TRANSMITTED DISEASES**

---

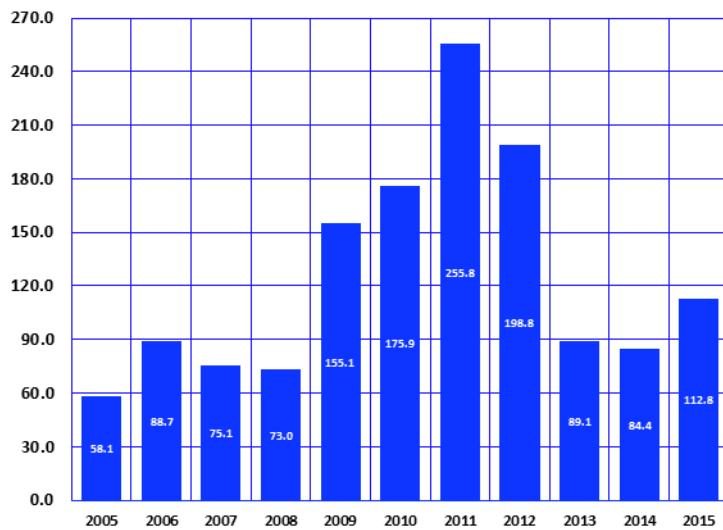

The infectious diseases designated as notifiable vary slightly by state. A notifiable disease is one for which regular, frequent, and timely information regarding individual cases is considered necessary for the prevention and control of the disease. All states generally report the internationally quarantinable diseases (i.e., cholera or plague) in compliance with the World Health Organization's International Health Regulations.

Data on morbidity, levels of disease, and disability in the Arizona population are obtained for certain infectious diseases that must be reported by law. The Bureau of Epidemiology and Disease Control Services conducts surveillance and monitoring of these reportable diseases and it provided data for the respective sections of this chapter and sections 5F, 6A, and 6B.

This section provides some illustrative findings from the tabulated data. It is not intended to be an exhaustive analysis of the incidence of infectious diseases in the State. There is more information available online on the website of the Office of Infectious Disease Services at: <http://azdhs.gov/phs/oids/index.htm>.

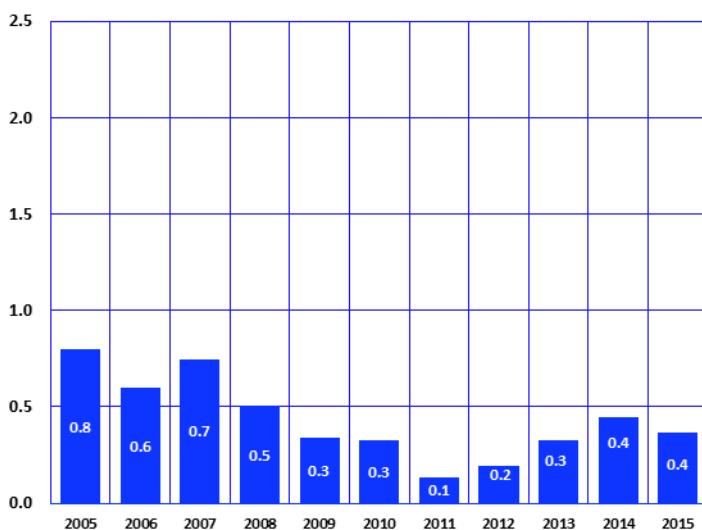

### 3A. NON-SEXUALLY TRANSMITTED DISEASES

**Figure 3A-1**  
**Trends in the Incidence Rates<sup>a</sup> of Valley Fever (Coccidioidomycosis) by Year, Arizona, 2005-2015**

Note: <sup>a</sup> Number of cases per 100,000 population.

**Figure 3A-2**  
**Trends in Case Fatality Rates<sup>a</sup> for Valley Fever (Coccidioidomycosis) by Year, Arizona, 2005-2015**

Note: <sup>a</sup> Number of deaths per 100 reported cases.

*Coccidioidomycosis* or *Valley Fever* is a fungal infection caused by inhalation of airborne spores that are present in the soil of southwestern United States, California, and parts of Central and South America. Most infections are asymptomatic or self-limited in patients with healthy immune systems. In rare instances, severe lung disease or disseminated infection can develop in patients.

*Valley Fever* imposed the greatest burden on morbidity among all non-sexually transmitted, notifiable diseases in Arizona in 2015. The reported incidence of *Valley Fever* increased 35.5 percent from 2014 ( $n=5,624$ ) to 2015 ( $n=7,622$ ). The 2015 incidence rate of 112.8/100,000 (**Figure 3A-1, Table 5F-2**) was 94.1 percent greater than the incidence rate of 58.1/100,000 in 2005, but was 55.9 percent lower than the incidence rate of 255.8/100,000 in 2011.

Twenty eight of the 7,622 Arizonans who had *Valley Fever* in 2015 died from it (**Table 3A-2**) for a case fatality rate of 0.4 deaths per 100 cases (**Figure 3A-2**). The 2015 case mortality rate for Coccidioidomycosis was 53.9 percent lower than in 2005.

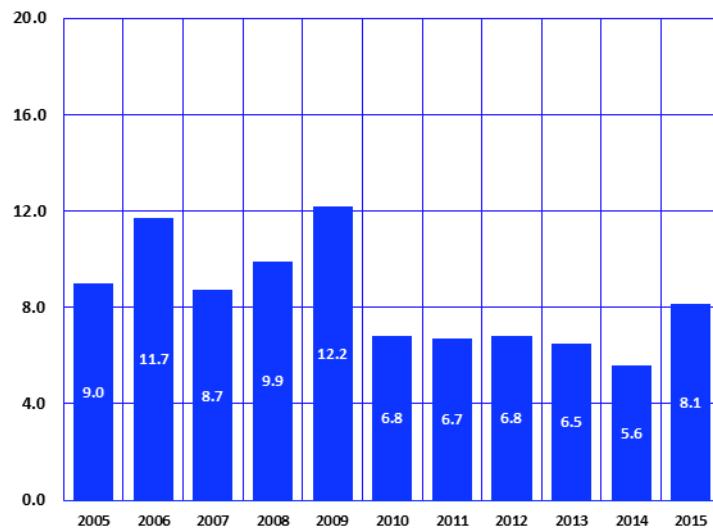

### 3A. NON-SEXUALLY TRANSMITTED DISEASES

*Shigellosis* is an infectious disease caused by a group of bacteria called *Shigella* that can cause diarrhea in humans. To spread from one person to another, *Shigellae* can be transmitted through contaminated foods, sexual contact, and water used for drinking or recreational purposes.

From 2005 – 2015, *shigellosis* was the third most common enteric disease to afflict Arizonans after *campylobacteriosis* and *salmonellosis* (**Table 3A-1**).

The number of reported cases of *shigellosis* in 2015 was 549, an increase from the number of cases observed in 2014 (n = 376). The incidence rate of *shigellosis* in 2015, 8.1 cases per 100,000, was among the highest incidence rate recorded for the first time since 2009 (**Figure 3A-3**).

**Figure 3A-3**  
Trends in the Incidence Rates<sup>a</sup> of Shigellosis by Year,  
Arizona, 2005-2015

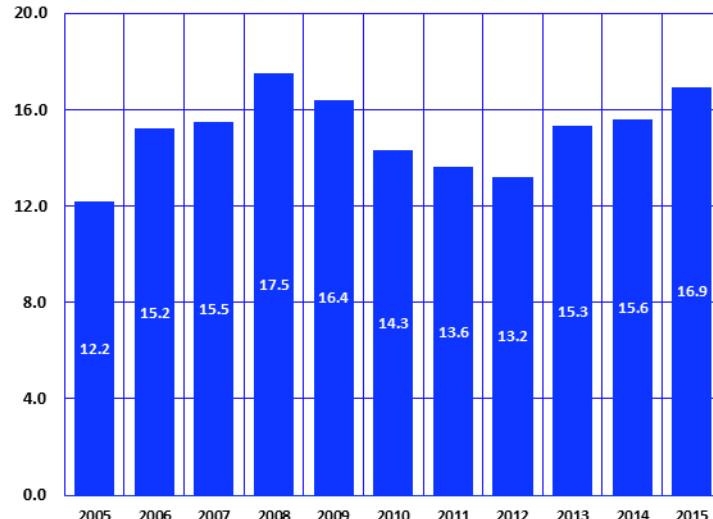

Note: <sup>a</sup> Number of reported cases per 100,000 population.

**Figure 3A-4**  
Trends in the Incidence Rates<sup>a</sup> of Salmonellosis<sup>b</sup> by Year,  
Arizona, 2005-2015

*Salmonellosis* is a bacterial infection. Most of those who are infected with *Salmonella* develop diarrhea, fever, and abdominal cramps.

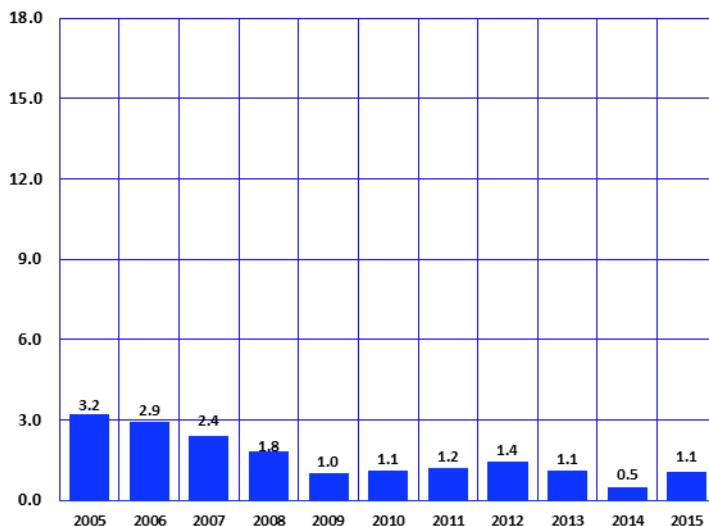

The incidence rate of *salmonellosis* increased 8.4 percent from 15.6/100,000 in 2014 to 16.9/100,000 in 2015 (**Figure 3A-4**). The risk of *salmonellosis* was substantially higher in Navajo (49.2/100,000) Graham (41.6/100,000), and La Paz (33.0/100,000) counties (**Table 5F-2**).

Notes: <sup>a</sup> Number of reported cases per 100,000 population; <sup>b</sup> Excluding *S. Typhi* and *S. Paratyphi*.

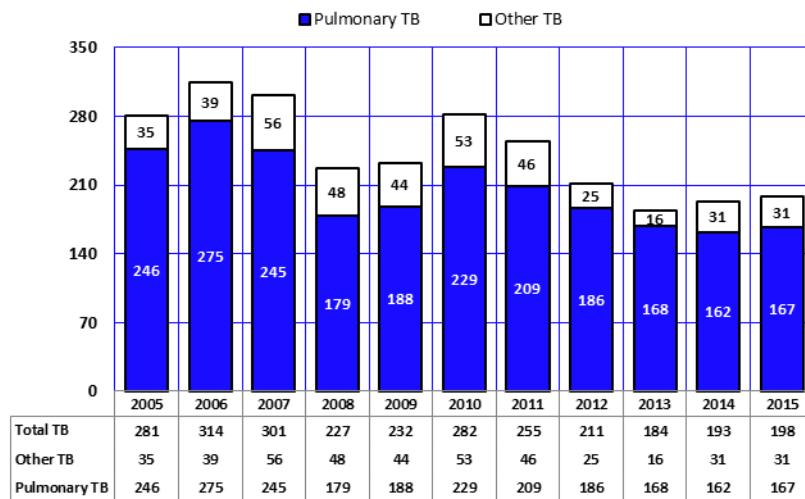

### 3A. NON-SEXUALLY TRANSMITTED DISEASES

**Figure 3A-5**  
**Trends in the Incidence Rates<sup>a</sup> of Hepatitis A by Year,  
 Arizona, 2005-2015**

Note: <sup>a</sup> Number of reported cases per 100,000 population.

**Figure 3A-6**  
**Trends in the Incidence of Pulmonary Tuberculosis and Total Tuberculosis<sup>a</sup> by Year, Arizona, 2005-2015**

Note: <sup>a</sup> Number of reported cases by year.

*Hepatitis A* is a liver disease caused by the *hepatitis A* virus. During 1995-1996, highly effective *hepatitis A* vaccines became available in the United States. Routine childhood vaccination for *hepatitis A* was recommended in 1999. The expansion of recommendations for routine *hepatitis A* vaccination to include all children in the United States aged 12-23 months is likely to reduce hepatitis rates further.

In Arizona, the incidence rate of *hepatitis A* decreased by 66.7 percent from 3.2/100,000 in 2005 to 1.1/100,000 in 2015 (**Figure 3A-5**).

Tuberculosis (TB) is an infectious disease that usually attacks the lungs, but can attack almost any part of the body. Tuberculosis is spread from person to person through the air.

The number of reported cases of pulmonary tuberculosis increased from 162 reported cases in 2014 to 167 cases in 2015. The number of reported cases of tuberculosis other than pulmonary remained stable at 31 since 2014 (**Figure 3A-6, Table 3A-1**). The incidence rate of total tuberculosis remained unchanged at 2.9/100,000 between 2014 and 2015 (**Table 5F-2**).

Pulmonary tuberculosis accounted for 84.3 percent of all tuberculosis infections in 2015 (**Table 3A-1**). Ten Arizonans who had tuberculosis died from it in 2015 (**Table 3A-2**).

Yersiniosis (except <i>Y. pestis</i> )	*	11	8	*	7	*	6	10	9	*	12

Notes: \* Cell suppressed due to non-zero count less than 6; Non-resident cases have been excluded. Only incident cases are reported. Cases are counted by date reported to public health. Case counts include both probable and confirmed cases unless otherwise indicated. *E. coli* has included both *E. coli* O157:H7 and Shiga-toxin positive *E. coli* since October 2004. *Haemophilus influenzae* type B includes all invasive *H. influenzae* B, not just meningitis, as of 1995. Meningococcal disease includes all invasive disease caused by *Neisseria meningitidis*, not just meningitis. Animal rabies cases are not included. Hepatitis D has been reported separately from Hepatitis non-A non-B since 1997. Hepatitis E has been reported separately from Hepatitis non-A non-B beginning in 1998. VRE ceased being reportable beginning in April 2008. Reported coccidioidomycosis cases were elevated from June 2009 through December 2012 and then declined in 2013 due to changes in reporting practices and laboratory testing from a major commercial laboratory. A change in the criteria for counting Lyme disease in 2013 may account for the increase in cases in that year. For additional statistics on these diseases, please see <http://www.azdhs.gov/preparedness/epidemiology-disease-control/index.php#data-stats-archive>.

### **3B.**

#### **SEXUALLY TRANSMITTED DISEASES**

---

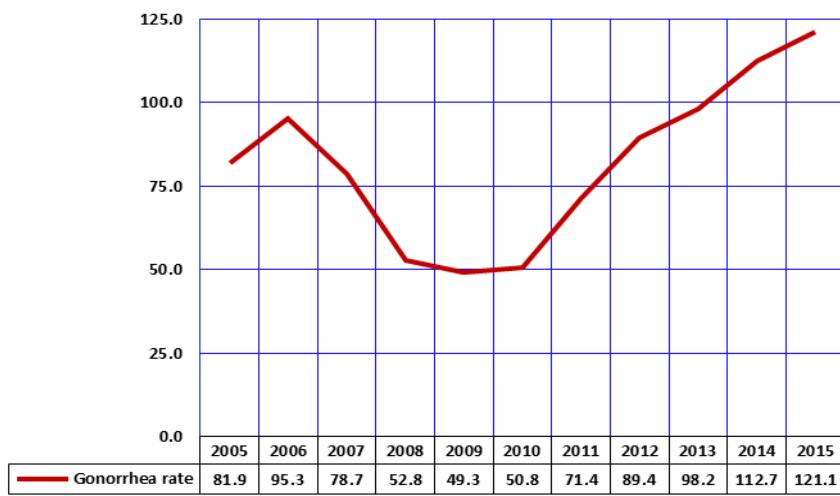

All states require that certain sexually transmitted diseases (STDs) be reported by physicians and other health care providers when they suspect that a case has occurred or they have laboratory confirmation.

It is important to note that disease reporting is likely incomplete and completeness may vary depending on the disease. Moreover, changes in methods for public health surveillance, or implementation of new diagnostic tests can cause changes in disease reporting that are independent of the true incidence of disease.\* In this section, rates for STDs were calculated using denominators based on 2015 estimates taken from the CDC.

\*Centers for Disease Control and Prevention. Summary of notifiable diseases – United States, 2008. Published June 25, 2010, for 2008; Vol. 57 (No. 54). Available online at <http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5754a1.htm>

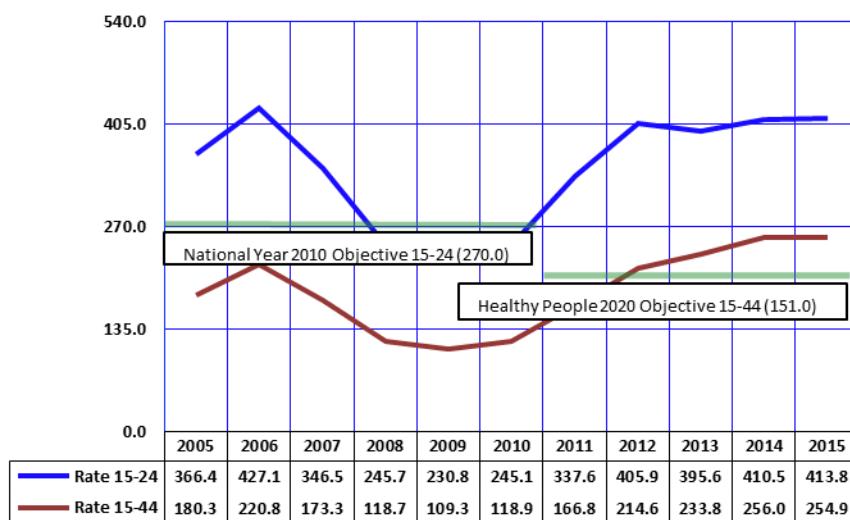

### 3B. SEXUALLY TRANSMITTED DISEASES

**Figure 3B-1**  
**Trends in the Incidence Rates<sup>a</sup> of Gonorrhea by Year, Arizona, 2005-2015**

Note: <sup>a</sup> Number of reported cases per 100,000 population.

**Figure 3B-2**  
**Trends in the Incidence Rates<sup>a</sup> of Gonorrhea among Females 15-24 and 15-44 Years, Arizona, 2005-2015**

Notes: <sup>a</sup> Number of reported cases per 100,000 females; There was a change in target rate and age range for Healthy People 2020 objective. In National Year 2010 objective was for females ages 15-24. In Healthy People 2020 objective is for females ages 15-44.

*Neisseria gonorrhoeae* infection is the second most commonly reported notifiable disease in the United States. (**Figure 3B-1**). The consistent steady increase in the incidence rate of gonorrhea since 2009 likely resulted from a combination of factors, such as changes in surveillance, increases in the number of tests performed, and actual increases in disease occurrence (**Figure 3B-1**).

The *Healthy People* 2010 objective HP25-2 defines the target rate for gonorrhea as equal to or lower than 19.1 cases per 100,000 population. However, the *Healthy People* 2020 target is for ages 15-44 and is set at 151.0/100,000 females and 147.0/100,000 males (**Table 6A-2**).

The 2015 incidence rate for gonorrhea was 254.9 per 100,000 for Arizona females age 15-44 years, meaning Arizona's incidence rate was higher than the *Healthy People* 2020 objective, and decreased 0.4 percent from 2014. Generally, the trend in gonorrhea incidence rates are similar for women age 15-24 and age 15-44, although the overall incidence rate is consistently higher for women age 15-24.

### 3B. SEXUALLY TRANSMITTED DISEASES

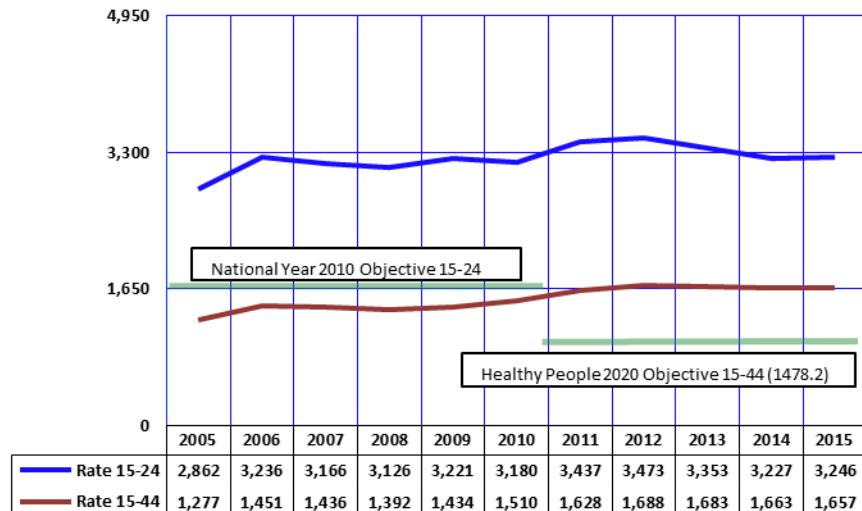

*Chlamydia trachomatis* is the most prevalent bacterial sexually transmitted disease in the United States (1,526,658 cases in 2015, with the highest rates reported among adolescents and young adults (**Table 3B-4**). Recent availability of sensitive tests for *chlamydia* using DNA amplification technology undoubtedly contributed to the increase in the number of reported cases in Arizona over the last decade (**Figure 3B-3, Table 3B-1**).

The incident rate of chlamydia was previously reported for females 15-24 years, however based on changes in *Healthy People 2020*, it would be reported for females 15-44 years. The *Healthy People 2020* goal for chlamydia is set at 1,478.2 per 100,000 females. The incidence rate for Arizona in 2015 was 1,657 per 100,000 females age 15-44 years (**Table 6A-2**).

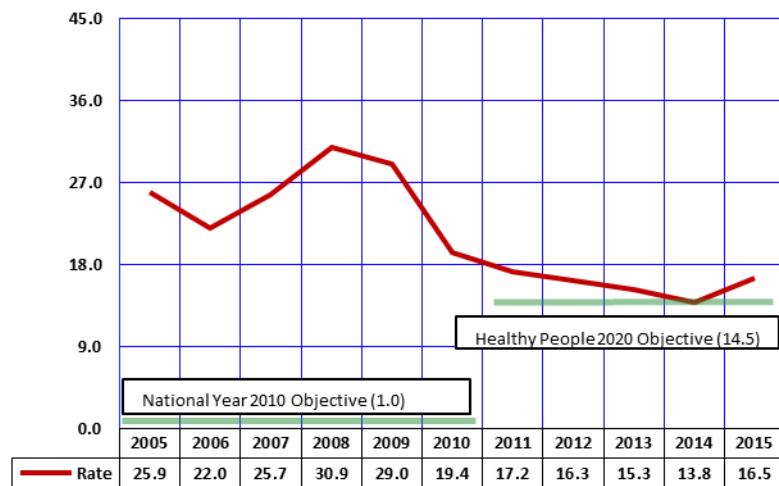

<http://www.cdc.gov/std/stats15/chlamydia.htm>

Notes: <sup>a</sup> Number of reported cases per 100,000 females; There was a change in target rate and age range for Healthy People 2020 objective. In National Year 2010 objective was for females ages 15-24. In Healthy People 2020 objective is for females ages 15-44.

**Figure 3B-3**  
**Trends in the Incidence Rates<sup>a</sup> of Chlamydia among Females 15-24 and 15-44 Years, Arizona, 2005-2015**

**Figure 3B-4**  
**Trends in the Incidence Rates<sup>a</sup> of Congenital Syphilis by Year, Arizona, 2005-2015**

*Congenital syphilis* (CS) is an infection caused by the spirochete *Treponema pallidum*, which can be passed from the mother to child during fetal development or birth. Not all infants born to infected women will be infected.

In 1988, CDC implemented a new CS case definition. It no longer relies on documentation of infection in the infant; rather, it presumes that an infant is infected if it cannot be proven that an infected mother was adequately treated for syphilis before or during pregnancy.

The *Healthy People 2020* goal for congenital syphilis is 14.5/100,000. In Arizona, the incidence rate of CS increased from 13.8/100,000 in 2014 to 16.5/100,000 in 2015 (**Figure 3B-4, Table 6A-2**).

### **3C.**

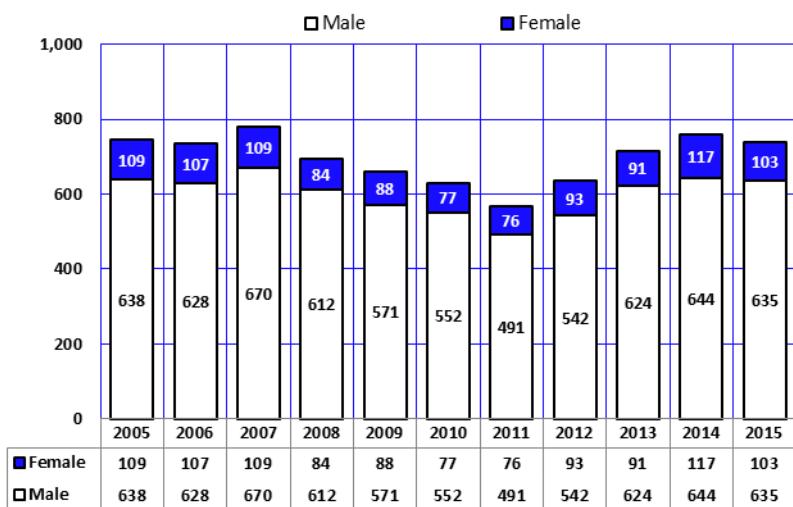

#### **HUMAN IMMUNODEFICIENCY VIRUS (HIV) DISEASE AND ACQUIRED IMMUNODEFICIENCY SYNDROME (AIDS)**

---

Statistics about the estimated incidence of Human Immunodeficiency Virus (HIV) disease and Acquired Immunodeficiency Syndrome (AIDS) for 1981-2015, as provided by the Office of HIV, STD, and Hepatitis Services, are available in Tables 3C-1, 3C-2, 3C-3, 3C-4, 3C-5 and 5F-3 of this report. In the past, the cases of persons previously reported as HIV positive and subsequently diagnosed with AIDS were not properly counted since these were not new cases, only a new diagnosis reflecting a progression of the disease. The data presented in this report are based on a revised approach adopted by the Office of HIV/AIDS Services. The estimated incidence of HIV/AIDS includes the sum of new HIV cases and new AIDS cases, which were not diagnosed as HIV positive in any prior calendar year. The cases of persons who were diagnosed with both HIV and AIDS in the same calendar year are counted only as AIDS to avoid double counting.

### 3C. HIV DISEASE AND AIDS

**Figure 3C-1**  
**Reported Cases of HIV/AIDS by Gender and Year of Diagnosis,  
 Arizona, 2005-2015**

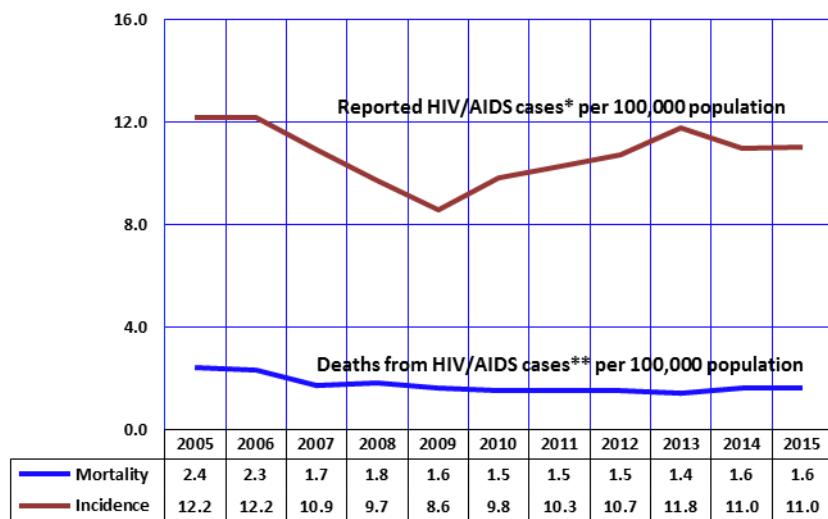

Since the first case of AIDS diagnosed in an Arizona resident in 1981, a total of 22,337 cases of HIV/AIDS had been diagnosed in the State by the end of 2015 and reported by July 1, 2016 (**Table 3C-1**).

In 2015, males accounted for 86.0 percent of all HIV/AIDS diagnoses. The male-to-female ratio of HIV/AIDS diagnoses in Arizona in 2015 was 6.2:1 (635/103, **Figure 3C-1, Table 3C-2**).

The proportion of risk behaviors attributed to emerging cases of HIV/AIDS in 2015 remained similar to previous years. Of the 738 HIV/AIDS cases diagnosed in 2015, 429 were among men who reported sexual contact with other men (**Table 3C-4**). Another 76 reported heterosexual contact. An additional 52 reported only injecting drugs. Adults without an indicated risk accounted for 135 of HIV/AIDS cases diagnosed in 2015.

**Figure 3C-2**  
**Trends in the Incidence Rates of HIV/AIDS and Mortality Rates for HIV Disease  
 by Year, Arizona, 2005-2015**

The incidence rate measures the relative risk for HIV/AIDS in a population. The incidence rate of HIV/AIDS has fallen in Arizona by 9.6 percent from 12.2 cases per 100,000 population in 2005 to 11.0/100,000 in 2015 (**Figure 3C-2**; the incidence rates for 2005 - 2015 have been re-computed based on the latest volume of the HIV/AIDS data as of 7/01/2016).

The rate of deaths from HIV disease remained unchanged from 2010 to 2012, then decreased slightly at 1.4 deaths per 100,000 population in 2013, followed by a modest increase to 1.6/100,000 during 2014-2015 (**Figure 3C-2**).

Of the 738 HIV/AIDS cases diagnosed in 2015, 266 were White non-Hispanic, 256 were Hispanic, 135 were Black, 53 were American Indian, and 21 were Asian or Pacific Islander (**Table 3C-3**).

Notes: \*By year of diagnosis; \*\*By year of death.
