

CHAPTER 1

REPRODUCTIVE AND PERINATAL HEALTH, ARIZONA, 2007-2017

- 1A. PREGNANCIES BY PREGNANCY OUTCOME,
RACE/ETHNICITY, AND AGE GROUP**
- 1B. NATALITY: MATERNAL CHARACTERISTICS
AND NEWBORN'S HEALTH**
- 1C. FETAL, PERINATAL, AND MATERNAL DEATHS**
- 1D. ABORTIONS**

1A.

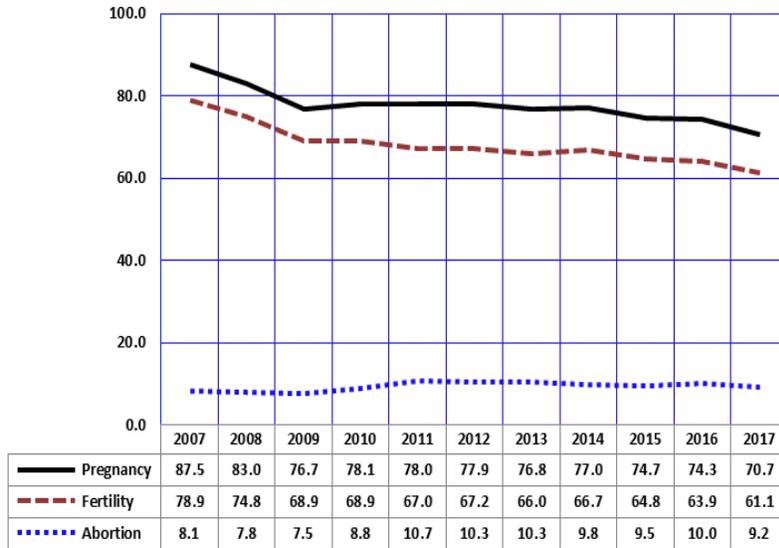

PREGNANCIES BY PREGNANCY OUTCOME, RACE/ETHNICITY, AND AGE GROUP

The expression “reproductive and perinatal health” refers to a variety of health and sociodemographic characteristics of women who became pregnant, factors related to the course of their pregnancies, and the status of pregnancy outcomes. In this report, pregnancies are measured as the sum of three components: **live births** (see Section 1B), **spontaneous terminations of pregnancy** (fetal deaths or stillbirths; Section 1C), and **abortions** (Section 1D).

There were 94,481 pregnancies in Arizona in 2017 compared to 98,060 in 2016, 98,027 in 2015, and 113,756 in 2007. The number of resident live births decreased by 3.2 percent, from 84,404 in 2016 to 81,664 in 2017 (**Table 1A-1**). The number of reported abortions decreased by 6.3 percent, from 13,170 in 2016 to 12,336 in 2017. The number of reportable spontaneous fetal losses decreased 1.0 percent, from 486 in 2016 to 481 in 2017.

1A. PREGNANCIES BY PREGNANCY OUTCOME, ETHNICITY, AND AGE GROUP

Figure 1A-1
Pregnancy, Fertility, and Abortion Rates^a by Outcome and Year among Females of Childbearing Ages (15 – 44 years), Arizona, 2007-2017

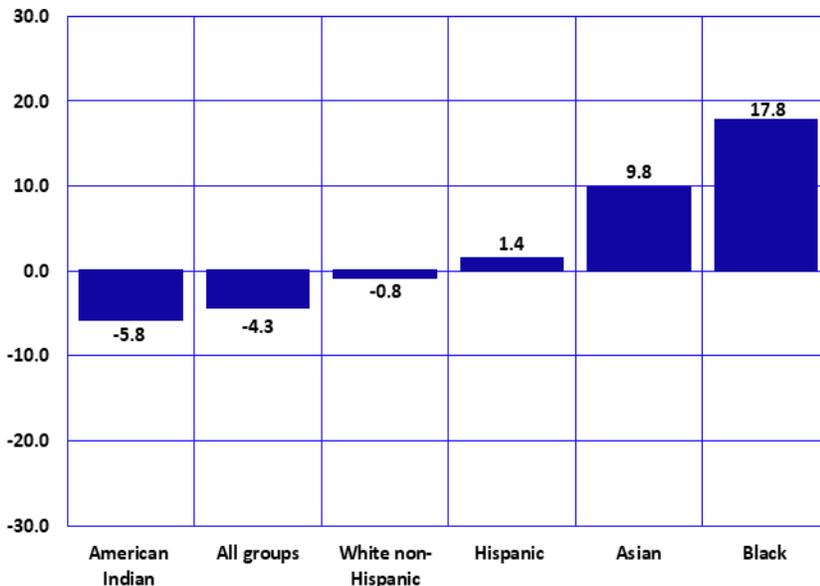

Rate is a measure of the frequency of some event (such as pregnancy, or live birth) in relation to a unit of population during a specified time period such as a year; events in the numerator of the year occur to individuals in the denominator. The pregnancy rate decreased slightly from 74.3 pregnancies per 1,000 females of childbearing age in 2016 to 70.7 pregnancies per 1,000 females of childbearing age in 2017 (**Figure 1A-1, Table 1A-1**).

The fertility rate (the number of births per 1,000 women of childbearing age) also decreased from 63.9/1,000 in 2016 to 61.1/1,000 in 2017. In 2017, the fertility rate was 22.5 percent lower than the high rate recorded in 2007.

Between 2016 and 2017, the abortion rate (the number of abortions per 1,000 women of childbearing age) decreased 8.0 percent from 10.0 to 9.2 per 1,000 women of childbearing age.

Note: ^aAll rates per 1,000 females in specified age group.

Figure 1A-2
Percent Change from 2013 to 2017 in the Number of Pregnancies by Woman's Race/Ethnicity, Arizona

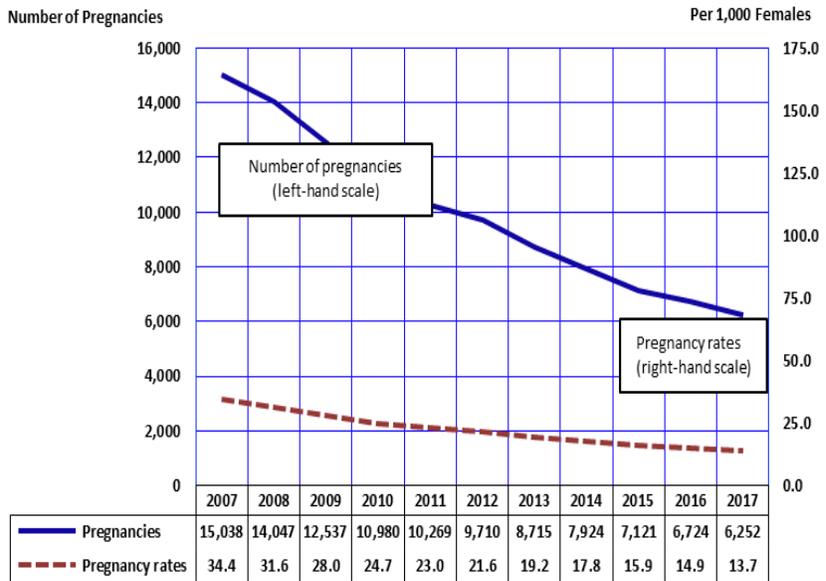

Overall, pregnancies in Arizona decreased 4.3 percent from 2013 to 2017. The changes in number of pregnancies varied by race/ethnicity. Between 2013 and 2017, while American Indian (5.8 percent) and White non-Hispanic females (0.8 percent) experienced a decrease in number of pregnancies, Black (17.8 percent), Asian (9.8 percent), and Hispanic females (1.4 percent) witnessed an increase in their pregnancy counts (**Figure 1A-2, Table 1A-1**).

1A. PREGNANCIES BY PREGNANCY OUTCOME, ETHNICITY, AND AGE GROUP

Figure 1A-3
Trends in the Number of Pregnancies and Pregnancy Rates^a
among Females 19 or Younger, Arizona, 2007-2017

There is a difference between pregnancy rates and the absolute number of pregnancies. The teen pregnancy rate measures the proportion of teenagers becoming pregnant in a given year; in other words, the relative “*risk for pregnancy*” in a population “*at risk*.” The number of pregnancies is also determined by the size of the population “*at risk*,” or in this case, by the number of teenage females in the population.

The number of teen pregnancies decreased by 58.4 percent from 15,038 in 2007 to 6,252 in 2017 (Figure 1A-3). The teen pregnancy rate declined even more, by 60.0 percent, from 34.4 pregnancies per 1,000 females 10-19 years in 2007 to 13.7 per 1,000 females in 2017. The number of teenage pregnancies and the teen pregnancy rate of 2017 were the lowest recorded since at least 1980.

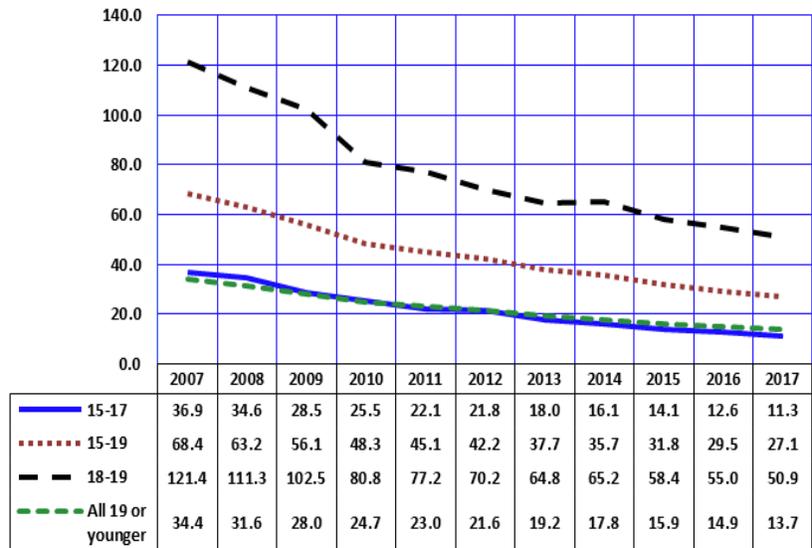

Note: ^a Pregnancy rate is the number of pregnancies per 1,000 females in specified age group.

Figure 1A-4
Pregnancy Rates^a by Age Group and Year among Females
19 or Younger, Arizona, 2007-2017

The pregnancy rate for Arizona teenagers 15-19 years old in 2017 was 27.1 pregnancies per 1,000 females (Figure 1A-4, Table 5A-2), 8.2 percent lower than 2016 and 60.4 percent lower than in 2007. The pregnancy rate for younger teenagers 15-17 years old declined by 69.4 percent (Table 1A-3) from 36.9/1,000 in 2007 to 11.3/1,000 in 2017. The pregnancy rate for older teenagers 18-19 years old declined by 58.0 percent from 121.4/1,000 in 2007 to 50.9/1,000 in 2017 (Table 1A-4).

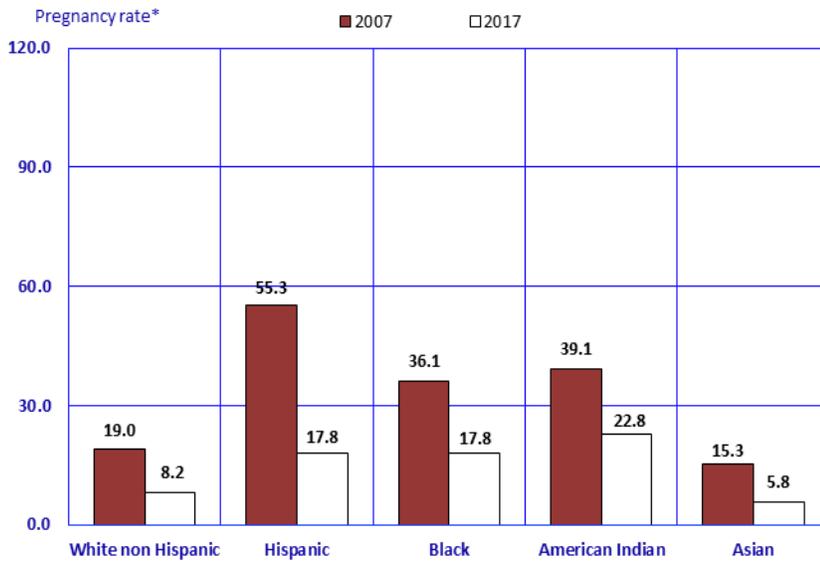

County-level information about teen pregnancies and pregnancy rates is provided in Table 5A-2, Table 5A-3, and Table 5A-5. Pregnancy statistics for Arizona are not available on a sub-county level.

Note: ^a All rates per 1,000 females in specified age group.

1A. PREGNANCIES BY PREGNANCY OUTCOME, ETHNICITY, AND AGE GROUP

Figure 1A-5
Comparison of Pregnancy Rates^a by Race/Ethnicity and Year among
Females 19 or Younger in Arizona, 2007 and 2017

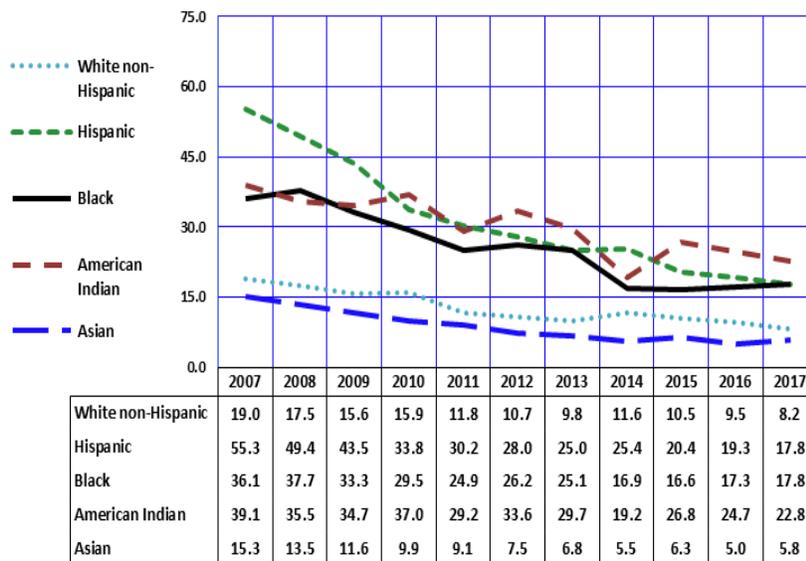

Teen pregnancy rates differ by race/ethnicity.

Between 2007 and 2017, pregnancy rates among females aged 19 and younger declined for all racial/ethnic groups (Figure 1A-5). The steepest decline in teenage pregnancy rates was recorded for Hispanic females, who experienced a 67.8 percent drop from 2007 to 2017. The Asian teenage pregnancy rate decreased greatly also, by 62.1 percent from 15.3 in 2007 to 5.8 in 2017.

The changes in annual teen pregnancy rates from 2007 to 2017 are shown in detail below.

Note: ^a All rates per 1,000 females in specified age group.

Figure 1A-6
Pregnancy Rates^a by Race/Ethnicity and Year among Females
19 or Younger, Arizona, 2007-2017

The teen pregnancy rates for all racial/ethnic groups were lower in 2017 than in 2007 (Figure 1A-6). Compared to 2017, the teen pregnancy rate decreased for all racial/ethnic groups, but more so among Hispanics and Asians than the remaining groups.

From 2016 to 2017, teenage pregnancy rates decreased 13.7 percent for White non-Hispanic females, 7.8 percent among American Indian and 7.6 percent for Hispanic females, while the rate increased 15.3 percent for Asian and 2.9 percent for Black females.

Note: ^a All rates per 1,000 females in specified age group.

1A. PREGNANCIES BY PREGNANCY OUTCOME, ETHNICITY, AND AGE GROUP

In 2017, Hispanic females accounted for approximately 43.3 percent of all females 10-19 years old in Arizona. As in the past, they accounted for a large percentage of teen pregnancies (56.2 percent) and live births (59.0 percent; **Figure 1A-7**). In contrast, White non-Hispanic females made up 42.5 percent of all females 10-19 years old in Arizona, but had a lower proportional contribution to teen pregnancies (25.2 percent) and live births (23.1 percent). Note: percentages are based on the number of pregnancies and births in **Table 1A-5**.

Figure 1A-7
Proportional Contribution by Race/Ethnicity to Pregnancies and Live Births among Females 19 or Younger, Arizona, 2017

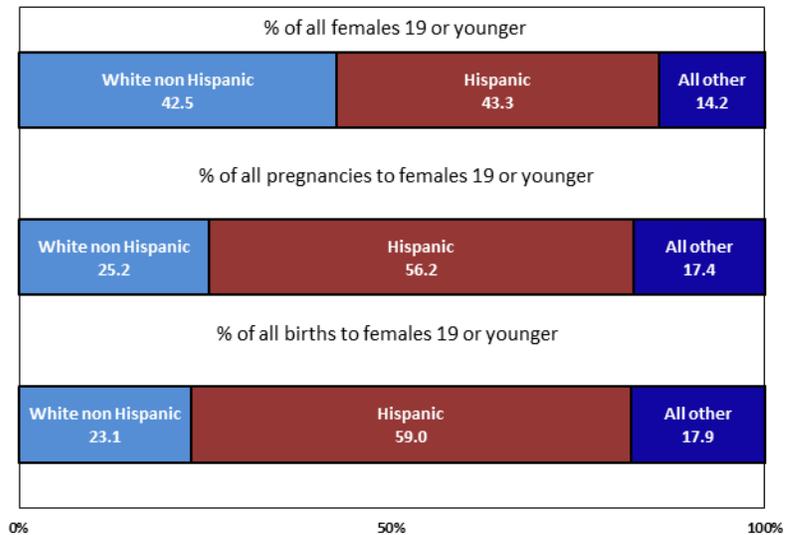

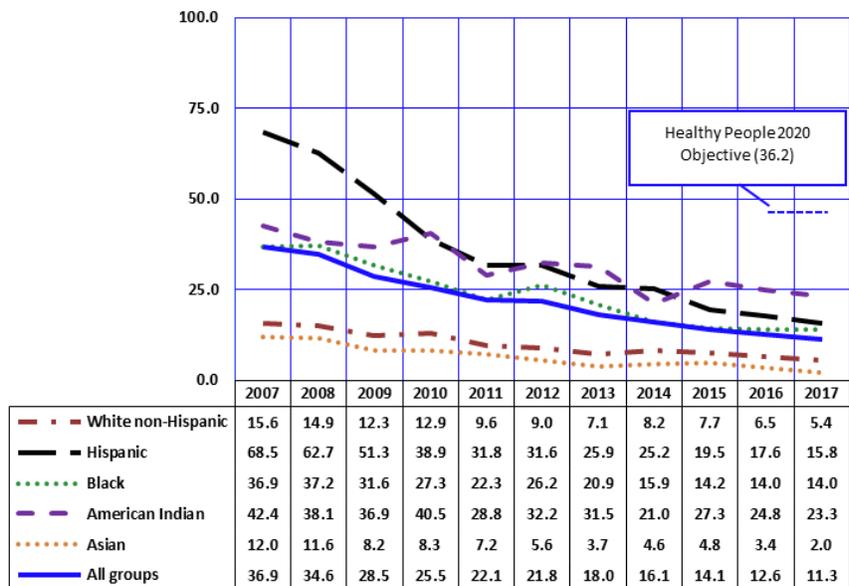

Figure 1A-8
Pregnancy Rates^a by Race/Ethnicity and Year among Females 15-17 Years: 2007-2017 and the "Healthy Arizona 2020" Objective

In 2017, the pregnancy rate of 11.3 pregnancies per 1,000 adolescent females 15-17 years old in Arizona was 68.8 percent lower than the **Healthy People 2020** objective of 36.2/1,000 (**Figure 1A-8**, **Table 1A-3**). The 2017 pregnancy rate among Asians age 15-17 was 94.5 percent than the objective and among White non-Hispanics 85.1 percent lower than the objective. While lower than the 2020 objective, the pregnancy rates of American Indians, Hispanics, and Blacks were substantially higher than their White non-Hispanic and Asian counterparts.

Note: ^a All rates per 1,000 females in specified age group.

1B.

**NATALITY:
MATERNAL CHARACTERISTICS AND NEWBORN'S HEALTH**

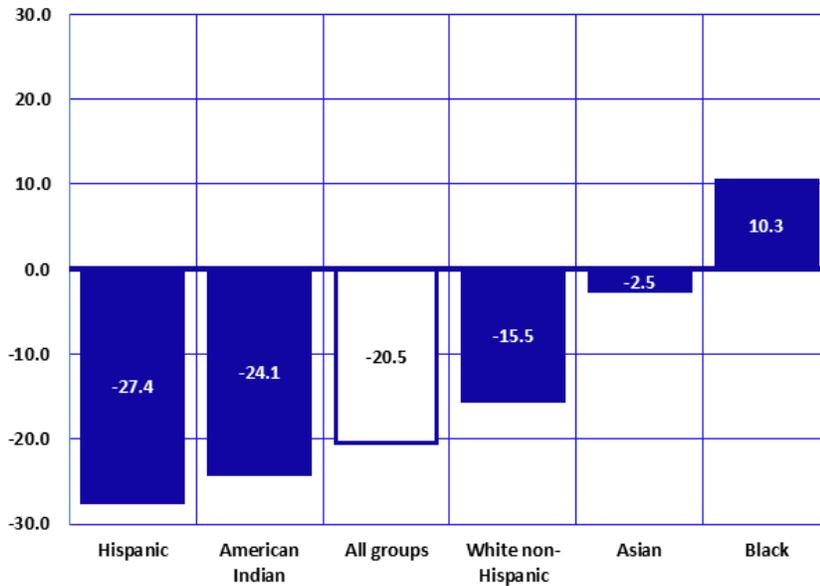

The number of resident births reached its recent peak in 2007 at 102,687 (**Table 1B-2**). In 2008, the number of resident births declined to 99,215; the first annual decline since 1991 (which, like 2008, also was an economic downturn year). Since 2008, the number of births declined until 2013, reaching a low of 84,963 resident births, the lowest number of births recorded in Arizona since 1999 (80,505). In 2017, there were 81,664 resident births, representing a reduction from the 84,404 births that occurred in 2016.

There were striking differences in how the number of births changed from 2007 to 2017 by mother's race/ethnicity. Compared to 2007, the number of births for all combined racial/ethnic groups was 20.5 percent lower in 2017, although the number of births rose by 10.3 percent for Black or African American mothers. Hispanic or Latino women experienced a decrease of 27.4 percent during this period (**Figure 1B-1**).

Since the 2008 edition of this report, we have been pointing out that Hispanics, unlike any other racial/ethnic group in the State were hit the hardest by the recession, which may explain the decline in their birth rate. However, it is important to note that the decline in births to Hispanic or Latino mothers started before the recession, then accelerated during the recession and even as the economy was recovering. Meanwhile, the estimated number of Hispanic women of childbearing age (15–44 years) has increased from 405,306 in 2007 to 497,456 in 2017. Hence, the decrease in Hispanic births may only be attributed in part to the unfavorable economic conditions of this group, and to a large extent to changes in childbearing behaviors, as more Hispanic women are delaying motherhood.

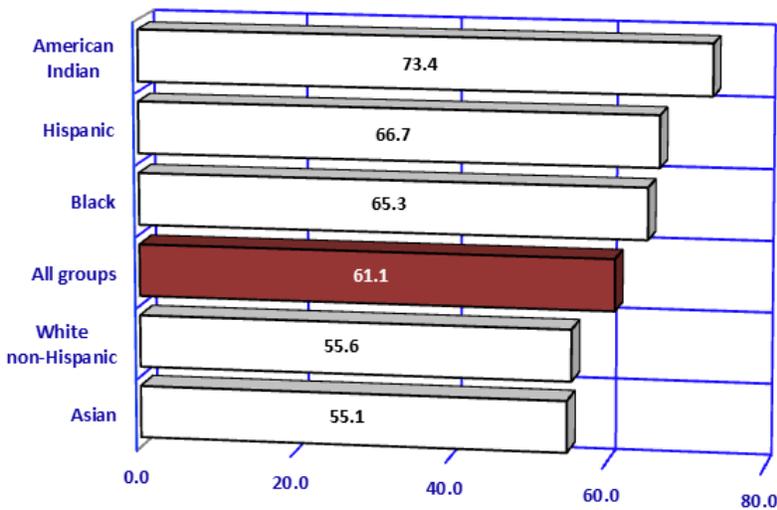

1B. NATALITY: MATERNAL CHARACTERISTICS AND NEWBORN'S HEALTH

Figure 1B-1
Percent Change from 2007 to 2017 in the Number of Resident Live Births by
Mother's Race/Ethnicity, Arizona

From 2007 to 2017, the number of resident live births declined by 20.5 percent (**Figure 1B-1**). All racial/ethnic groups experienced a decrease in the number of live births, with the exception of Blacks. The magnitude of the reduction in the number of births was the largest among Hispanics or Latinos (-27.4 percent) and American Indians (-24.1 percent).

Figure 1B-2
General Fertility Rates^a by Race/Ethnicity among Females of all Ages,
Arizona, 2017

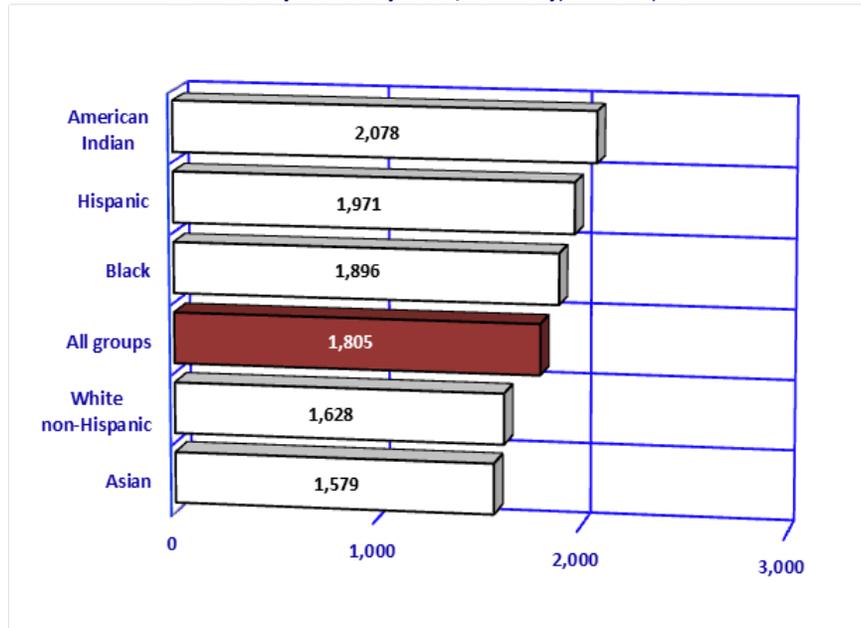

From among 1,336,057 women of childbearing age (15-44 years), 6.0 percent gave birth in 2017. The *general fertility rate* (the number of births per 1,000 women 15-44 years old; GFR) was the highest for American Indian followed by Hispanic females, and Black females. The GFR for Asian females was the lowest of all racial/ethnic groups.

A comparison of fertility rates by county in Arizona is provided in **Table 5A-1**.

Note: ^a Number of births per 1,000 females 15-44 years old in specified group.

1B. NATALITY: MATERNAL CHARACTERISTICS AND NEWBORN'S HEALTH

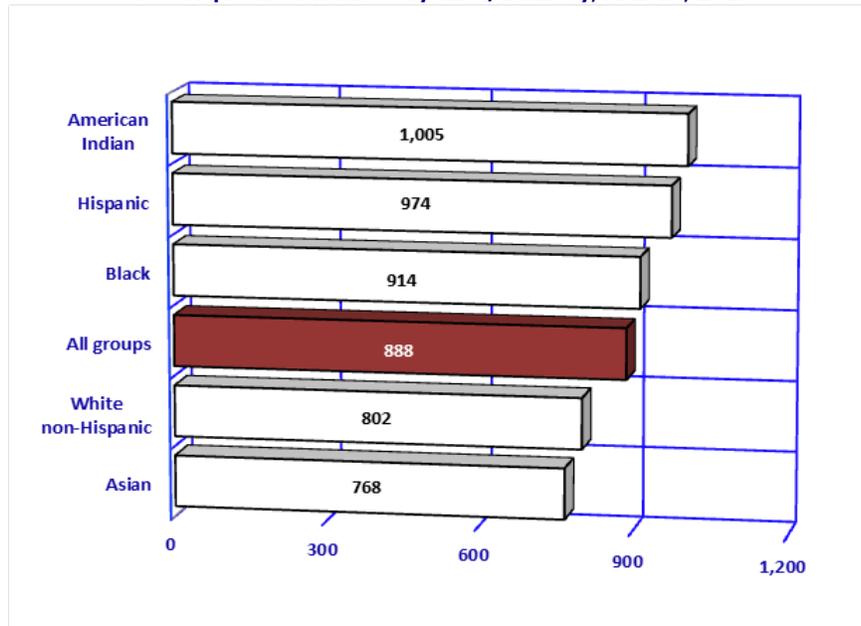

Figure 1B-3
Total Fertility Rates^a by Race/Ethnicity, Arizona, 2017

The *total fertility rate* (TFR) indicates the average number of births to a hypothetical cohort of 1,000 women, if they experienced the age-specific birth rates observed in a given year throughout their childbearing years. From 2003 to 2008, Arizona's TFRs always exceeded the rate of "replacement" (2,110 births per 1,000 women, **Table 1B-1**). The "replacement" rate is considered the value at which a given generation can exactly replace itself. The TFR was 2,058 births per 1,000 women of childbearing age in 2009 and 2010, decreasing to 1,805 in 2017. In 2017, The TFR for American Indian women (2,078) fell below the generation replacement rate by 1.5 percent. The rate for Asian women (1,579), -the lowest of all groups- was 25.2 percent lower than the replacement rate.

Notes: ^a The sum of age group-specific birth rates multiplied by five (the number of years in the age group). The rate of 1,805 above for example, means that if a hypothetical group of 1,000 women were to have the same birth rates in each age group that were observed in the actual childbearing population in 2017, they would have a total of 1,805 children (or 1.8 children each) by the time they reached the end of the reproductive period (taken here as age 50), assuming that all of the women survived to that age.

Figure 1B-4
Gross Reproduction Rates^a by Race/Ethnicity, Arizona, 2017

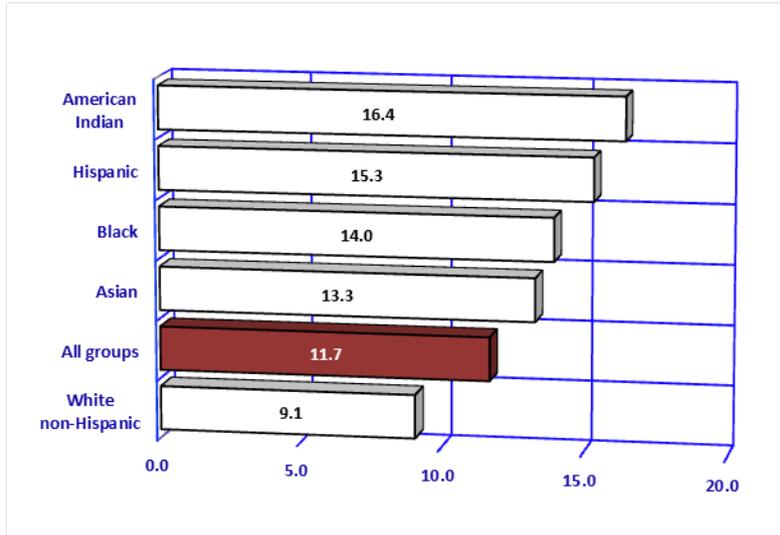

Another measure used to summarize reproduction patterns is the *gross reproduction rate* (GRR). It represents the average number of daughters born to a hypothetical cohort of 1,000 women if they experienced the age-specific birth rates observed in a given year throughout their childbearing years. This measure is similar to the total fertility rate except that it measures only female births, since reproduction is largely dependent on the number of females in a given population. In 2017, the gross reproduction rates in Arizona ranged from 768 for Asian women to 1,005 for American Indian women (**Figure 1B-4, Table 1B-1**).

Notes: ^a The sum of birth rates by 5-year age groups multiplied by the proportion of births which were female. The gross reproduction rate represents the average number of daughters born to a hypothetical cohort of 1,000 women if they experienced the age-specific birth rates observed in a given year throughout their childbearing years, and if none of the cohort was to die during their childbearing years.

1B. NATALITY: MATERNAL CHARACTERISTICS AND NEWBORN'S HEALTH

Figure 1B-5
Birth Rates^a by Race/Ethnicity, Arizona, 2017

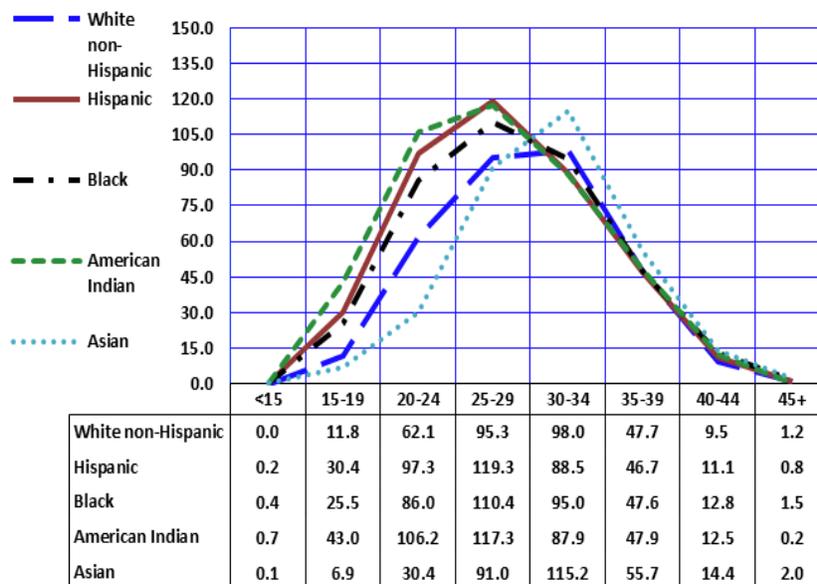

The crude birth rate, often simply called the birth rate, relates the number of births to the total population in a specified group. The birth rate is expressed as the total number of births per 1,000 persons, without regard to the age or sex distribution of the population.

The birth rate for Arizona decreased from 12.3 in 2016 to 11.7 in 2017.

In 2017, the crude birth rates by mother's race/ethnicity ranged from 9.1 births per 1,000 White non-Hispanics to 16.4 per 1,000 American Indians (**Figure 1B-5**).

Note: ^a Number of births per 1,000 population in specified group.

Figure 1B-6
Birth Rates^a by Mother's Age Group and Race/Ethnicity, Arizona, 2017

The age-specific birth rates (the number of births to mothers in a particular age group per 1,000 women in that age group) differed substantially by race/ethnicity (**Figure 1B-6**).

In 2017, American Indian and Hispanic women had the highest birth rates for women under the age of 25 years. The birth rates for women between the ages of 30-34 and 35-39 were the highest among Asian women. In general, Hispanic, Black, and American Indian women tend to give birth at younger ages than Asian and non-Hispanic White women.

Note: ^a Number of births per 1,000 females in specified group.

1B. NATALITY: MATERNAL CHARACTERISTICS AND NEWBORN'S HEALTH

Figure 1B-7
Percent of Births to Unmarried Mothers by Age Group, Arizona, 2017

Unmarried mothers have accounted for an increasing annual proportion of births throughout the 1980s and 1990s, with 44.8 percent in 2016 (Table 1B-2). In 2017, 36,298 infants were born to unmarried mothers compared to 46,195 in 2007. It is important to note that beginning 2015, divorced mothers have been included in the proportion of unmarried mothers; therefore caution should be exercised in comparing data for this year to those of the previous years.

A decade ago, the proportion of births among unmarried women aged 20-24 years was 60.3 percent, while in 2017, approximately 66 percent of mothers 20-24 years old were unmarried (Figure 1B-7).

Births and birth ratios by mother's marital status, age group, and race/ethnicity are given in (Table 1B-22). County-level information is provided in (Table 5B-14 and 5B-15).

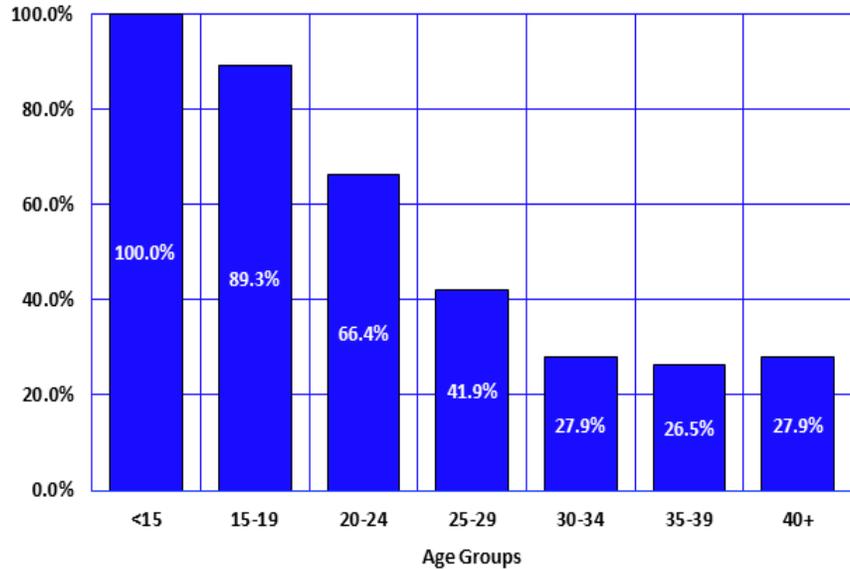

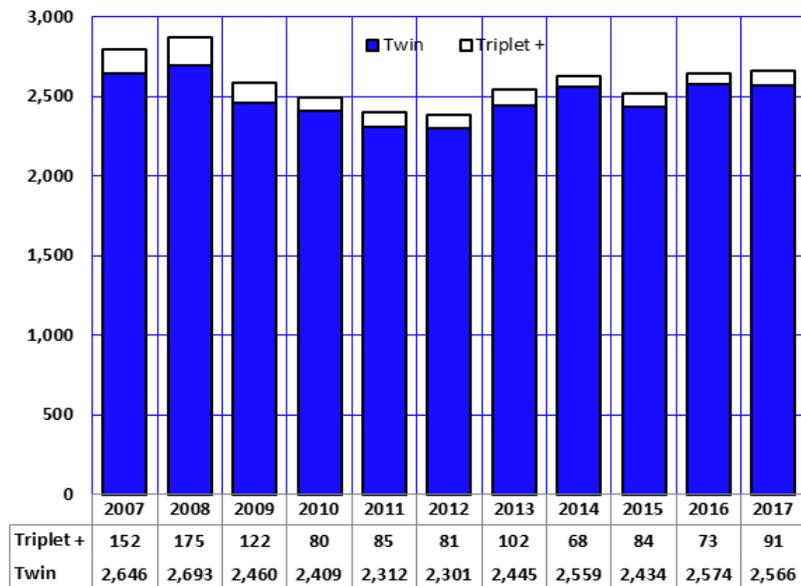

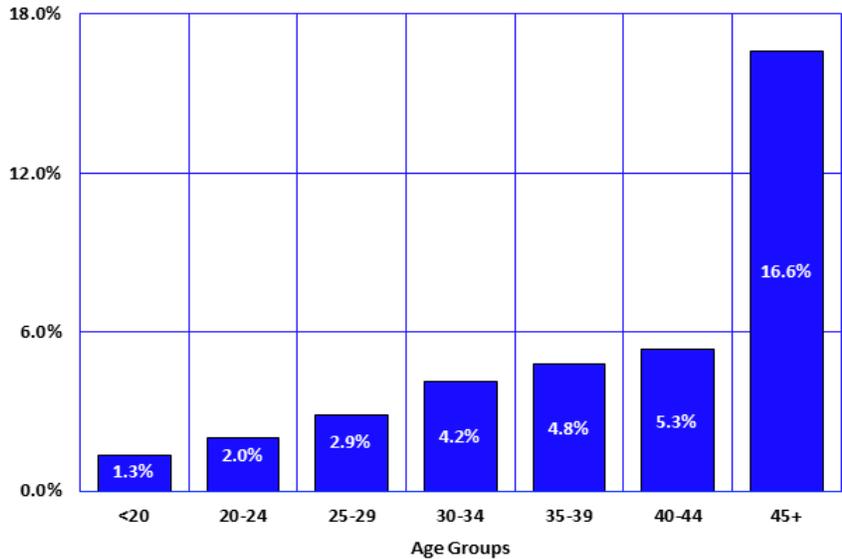

Figure 1B-8
Number of Births in Twin and Triplet+ Deliveries by Year, Arizona, 2007-2017

The number of multiple birth events in Arizona declined from 2,868 in 2008, (the highest number ever recorded) to 2,657 in 2017 (Figure 1B-8). The number of babies born in twin deliveries decreased from 2,693 in 2008 to 2,566 in 2017 (Figure 1B-8). The number of triplets and higher order multiple birth events decreased by 48.0 percent from 175 in 2008 to 91 in 2017.

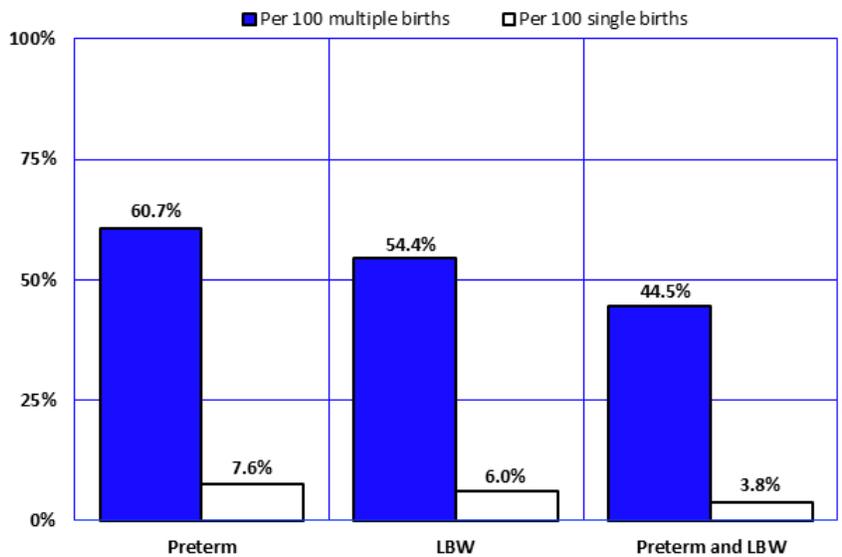

1B. NATALITY: MATERNAL CHARACTERISTICS AND NEWBORN'S HEALTH

Figure 1B-9
Multiple Births by Mother's Age Group, Arizona, 2017

In 2017, the proportion of multiple births gradually increased with maternal age among mothers below 45 years of age and sharply increased among mothers age 45 years and older. Among women aged 45 years and older, 16.6 percent of all births were twins, triplets, or quadruplets (**Figure 1B-9**). The percent of all births that were multiple births to women age 45 and over increased from 15.8 percent in 2016 to 16.6 percent in 2017. Ongoing monitoring of multiple births among older mothers will help better understand the recent variation that has been found in this measure.

Figure 1B-10
Infants Born too Early (Preterm)^a and Infants Born too Small (LBW)^b among Multiple and Single Births, Arizona, 2017

Infants born in multiple deliveries tend to be born at shorter gestation age and with low birth weight than those born in singleton deliveries (**Figure 1B-10**). In 2017, infants born in multiple deliveries were 11.7 times more likely (44.5 vs. 3.8 percent) to be born earlier than expected (at less than 37 completed weeks of gestation) and smaller (at less than 2,500 grams) than singleton births.

Preterm birth is a leading cause of infant morbidity and mortality, accounting for 62.1 percent of all infant deaths (only those with matching death records); (**Figure 2C-4** in section 2C on Age-Specific Mortality). The weight of the newborn also is an important predictor of future morbidity and mortality. Infants born at low birth weight (<1,500 grams) account for 47.5 percent of all infant deaths (**Figure 2C-3**).

Notes: ^a Preterm is < 37 weeks of gestation; ^b Low birthweight is less than 2,500 grams or 5 pounds 8 ounces.

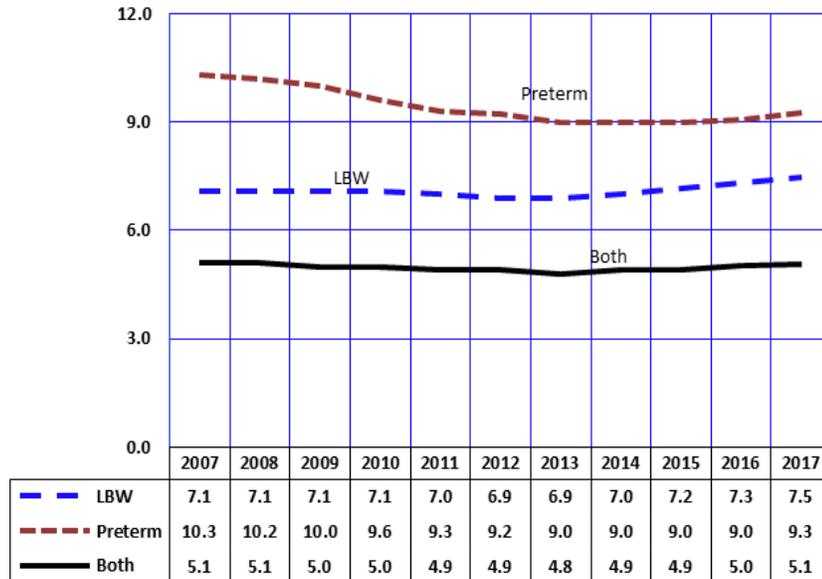

1B. NATALITY: MATERNAL CHARACTERISTICS AND NEWBORN'S HEALTH

Figure 1B-11
Preterm^a and Low Birthweight (LBW)^b Births by Year, Arizona, 2007-2017

The proportion of preterm births reached 9.3 percent of all births in 2017, an increase from 9.0 percent, the recorded rate since 2013.

The proportion of infants born prematurely and who were also low birth weight (LBW; at less than 2,500 grams) slightly increased from 5.0/100 births in 2016 to 5.1/100 births in 2017 (Figure 1B-11).

Detailed characteristics of births by birthweight and gestational age are provided in Table 1B-32. Comparative data by county of residence are available in Table 5B-16 – Table 5B-24.

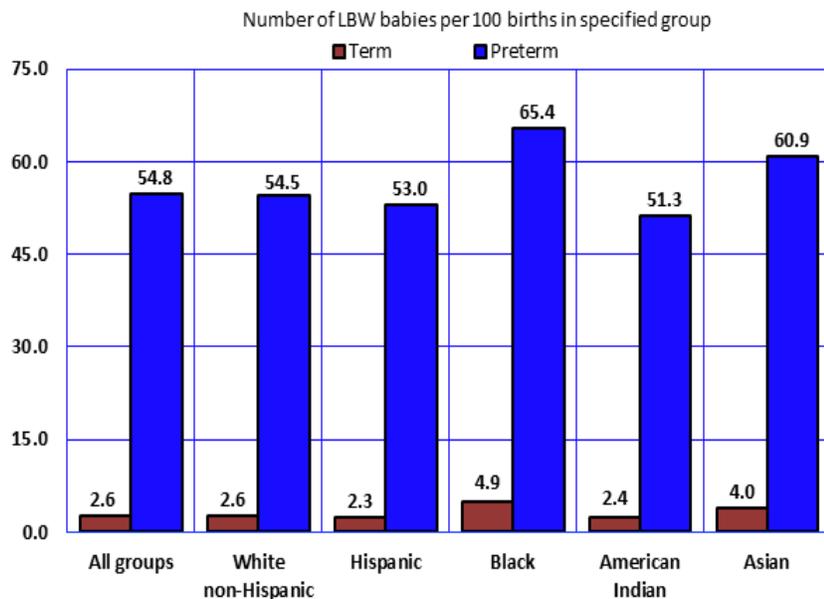

Notes: ^a Preterm: < 37 weeks of gestation; ^b Low birthweight (less than 2,500 grams or 5 pounds 8 ounces); In this report, the primary measure used to determine the gestational age is the clinical estimate of gestation as reported on the birth certificate.

Figure 1B-12
Low-Birthweight (LBW) Births by Length of Gestation and Mother's Race/Ethnicity, Arizona, 2017

From 2007 to 2017, between 7.1 and 7.5 percent of all babies were born at low birthweight (LBW), or at less than 2,500 grams (5 pounds 8 ounces). Preterm delivery is the strongest risk factor for LBW. Infants born at less than 37 completed weeks of gestation were 20.8 times (54.8 vs. 2.6 percent)* more likely to be LBW than infants born at term (Figure 1B-12). Seven out of ten (67.8 percent) LBW babies born in 2017 were preterm (Table 1B-3).

County-level data for LBW newborns are available in Tables 5B-16 – 5B-23. Community-level information is in Table 9A.

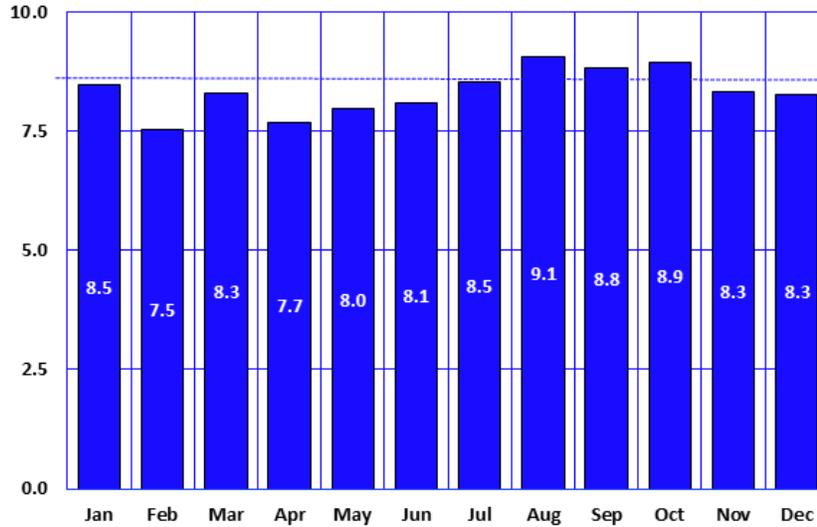

Notes: Number of LBW babies per 100 births in specified group; Preterm: < 37 weeks of gestation; Low birthweight (less than 2,500 grams or 5 pounds 8 ounces).

*A production error occurred in the 2016 report and has now been corrected. The updated statement is as follows: Infants born at less than 37 completed weeks of gestation were 22.2 times (55.6 vs. 2.5 percent) more likely to be LBW than infants born at term.

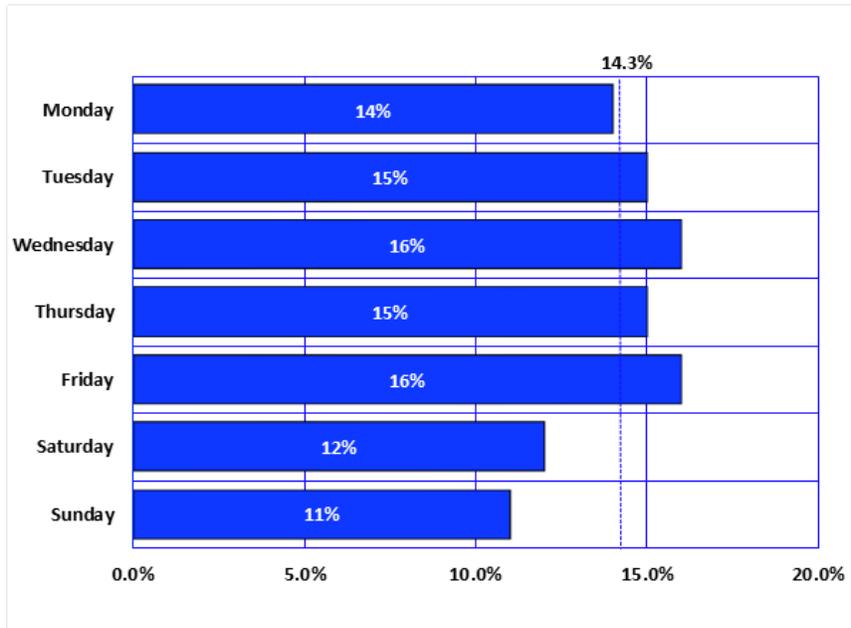

1B. NATALITY: MATERNAL CHARACTERISTICS AND NEWBORN'S HEALTH

Figure 1B-13
Percent of Resident Births by Month, Arizona, 2017

Historically, births in Arizona have peaked during August and September, with a monthly average around 8.3 percent. (Figure 1B-13). In 2017, the seasonal fluctuation of the frequency of births is marked by peak in August, September, and October.

Figure 1B-14
Percent of Resident Births by Day of the Week, Arizona, 2017

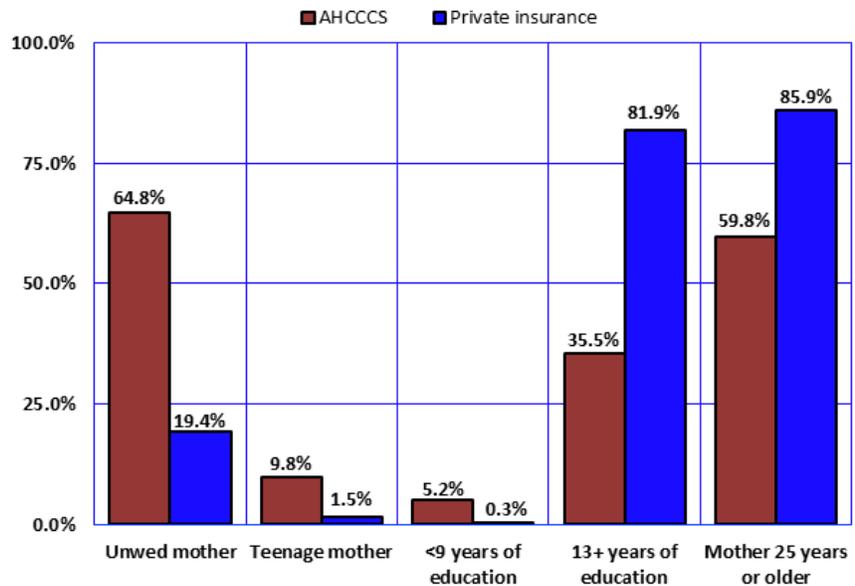

On average, 224 infants were born per day in 2017 to Arizona residents. The daily average of resident live births in 2017 was substantially lower on weekends than on weekdays (Figure 1B-14). Many studies suggest that weekly, daily, and hourly variations observed in hospitals and clinics are not due to a biological rhythm of labor, but to increased frequency of obstetric interventions in the timing of delivery (induced labors and elective cesarean deliveries), making it more aligned with the work week schedule.

In 2017, only 8.5 percent of cesarean deliveries occurred on Sundays, compared to 16.4 percent on Mondays. The average rate of induction of labor was substantially lower on weekend days (11.5 percent) than it was on week days (15.4 percent).

1B. NATALITY: MATERNAL CHARACTERISTICS AND NEWBORN'S HEALTH

The number of years of maternal education was the only possible proxy of socioeconomic status (SES) on the birth certificate prior to 1989. Paying party for the delivery became another SES indicator in 1989. The Arizona Health Care Cost Containment System (AHCCCS, the State's Medicaid Program) versus private health insurance (PHI) compares mothers of lower and higher SES respectively. PHI mothers were 2.3 times more likely to have some college education than were AHCCCS mothers (81.9 and 35.5 percent respectively, **Figure 1B-15**). Around 5 percent of AHCCCS mothers had 0-8 years of education, 16.0 times the proportion of PHI mothers. Only 19.4 percent of mothers with PHI were unmarried compared to 64.8 percent of AHCCCS mothers. Nine out of ten mothers with PHI were at least 25 years old compared to 6 out of 10 AHCCCS mothers.

Figure 1B-15
Comparison of Selected Sociodemographic Characteristics by the Payer for Delivery, Arizona, 2017

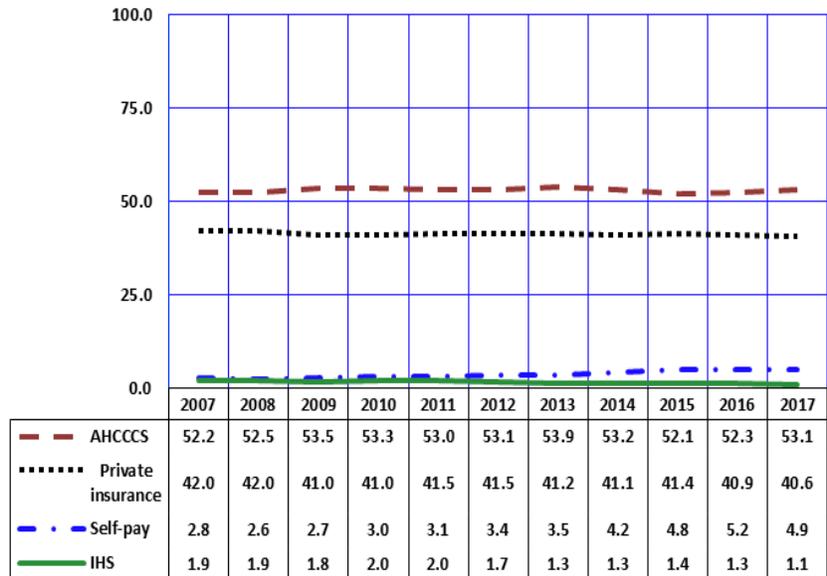

Note: The Arizona Health Care Cost Containment System (AHCCCS) is the State's Medicaid program.

Since 2002, the share of resident births paid for by AHCCCS has exceeded the share paid by private health insurance (**Figure 1B-16**). In 2007, private insurance funded 42.0 percent of births and AHCCCS paid for 52.2 percent of births. Compared to 2007, AHCCCS paid for 1.7 percent more births in 2017 and private insurance paid for 3.2 percent fewer births in 2017.

The share of AHCCCS funded births varied little from 2007 to 2017. The share of private health insurance also remained stable during this time period. In 2017, the payment source was the mothers themselves and/or their families (i.e. self-pay) in 4.9 percent of the deliveries. The Indian Health Service (IHS) paid for 1.1 percent of the births in 2017, a slight decrease from last year (**Table 1B-25 and Table 1B-27**).

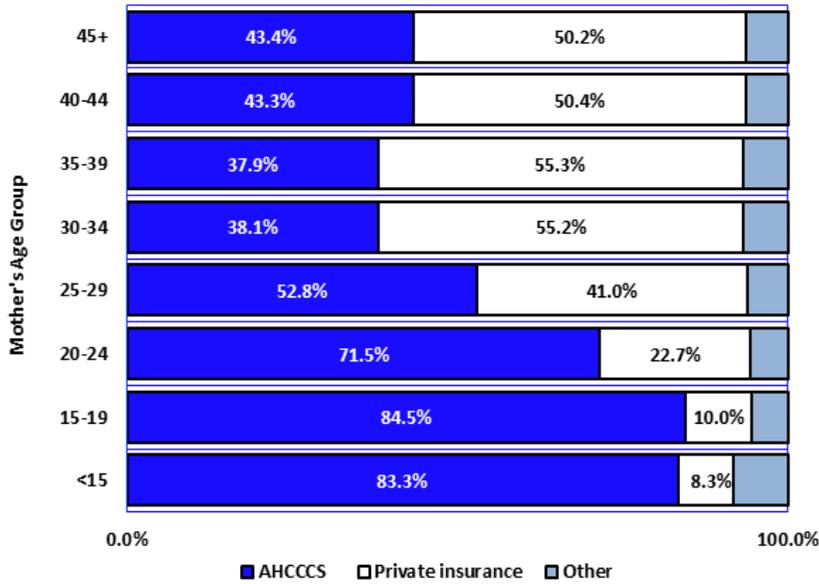

Figure 1B-16
Births by Payer and Year, Arizona, 2007-2017

Notes: The Arizona Health Care Cost Containment System (AHCCCS) is the State's Medicaid program; IHS is the Indian Health Service.

1B. NATALITY: MATERNAL CHARACTERISTICS AND NEWBORN'S HEALTH

Figure 1B-17
Payer for Delivery by Mother's Age Group, Arizona, 2017

In 2017, the Arizona Health Care Cost Containment System (AHCCCS) paid for the majority of the deliveries to mothers 29 years or younger (**Figure 1B-17**). In contrast, private insurance was the largest payer for the deliveries of women giving birth who were 30 years old or older in 2017 (based on data in **Table 1B-28**).

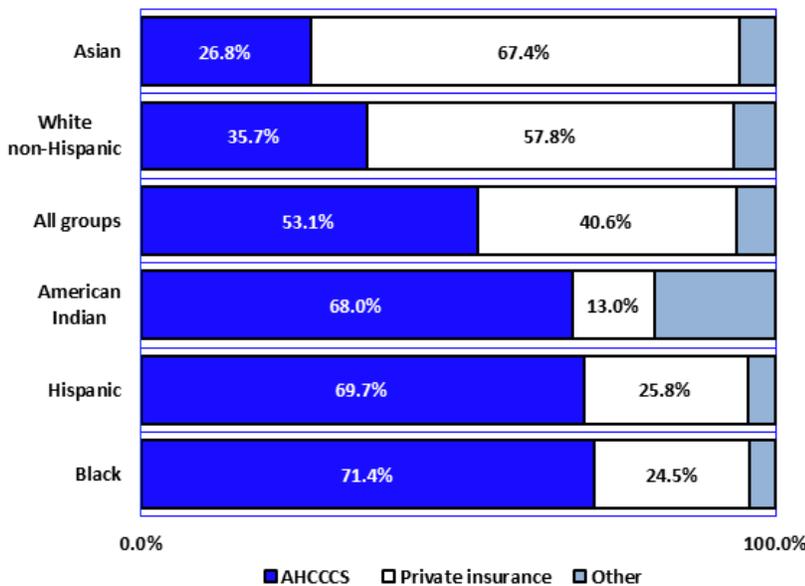

For each of the age groups the AHCCCS share substantially increased since 1989. Below are the proportions of deliveries paid for by AHCCCS in 1989:

- <15 years: 45.3 percent
- 15-19 years: 49.0 percent
- 20-24 years: 34.3 percent
- 25-29 years: 19.4 percent
- 30-34 years: 14.5 percent
- 35-39 years: 13.9 percent
- 40+ years: 14.2 percent.

From 1989 to 2017, the share of births paid for by AHCCCS more than doubled among mothers 20 years old or younger.

Note: The Arizona Health Care Cost Containment System (AHCCCS) is the State's Medicaid program.

Figure 1B-18
Payer for Delivery by Mother's Race/Ethnicity, Arizona, 2017

In 2017, private insurance was the largest payer for deliveries of Asian (67.4 percent) and White non-Hispanic infants (57.8 percent). In contrast, the Arizona Health Care Cost Containment System was the largest payer for deliveries of Black or African American (71.4 percent), Hispanic or Latino (69.7 percent), and American Indian women (68.0 percent).

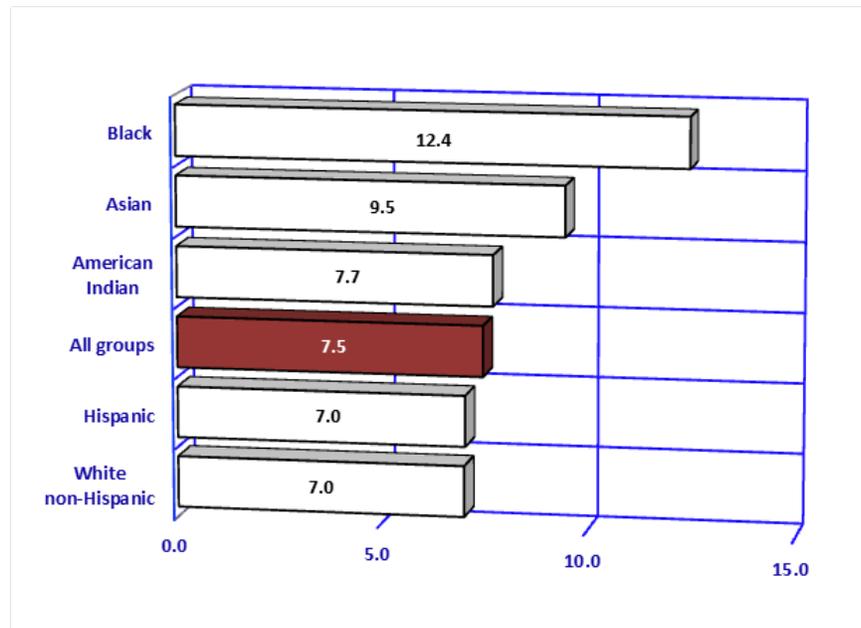

The Indian Health Service as a payer accounted for 16.6 percent of deliveries of American Indian or Alaska Native infants in the State (**Figure 1B-18**, based on data in **Table 1B-27**).

Hispanics or Latinos accounted for 53.4 percent of the 43,366 deliveries paid for by AHCCCS. About 29.4 percent of all AHCCCS births were to White non-Hispanic women (based on data in **Table 1B-27**).

Notes: The Arizona Health Care Cost Containment System (AHCCCS) is the State's Medicaid program; Other includes Indian Health Service, self-pay, or unknown.

1B. NATALITY: MATERNAL CHARACTERISTICS AND NEWBORN'S HEALTH

Figure 1B-19
Percent of Low Birthweight^a by Mother's Race/Ethnicity,
Arizona Residents, 2017

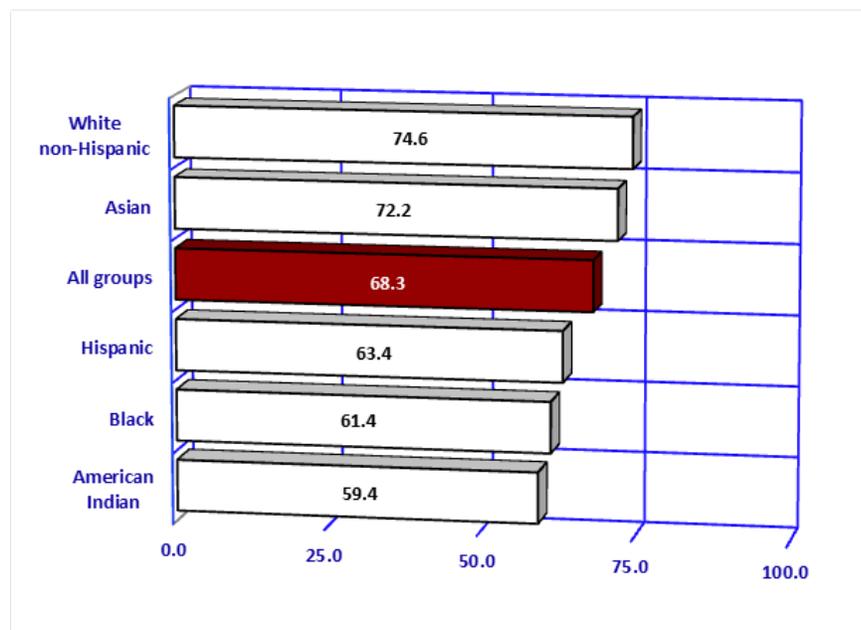

Note: ^a Low birthweight is less than 2,500 grams (less than 5 pounds 8 ounces).

In 2017, 7.5 percent of all Arizona infants were born at a low birthweight (LBW), or at less than 2,500 grams (5 pounds 8 ounces).

In Arizona, LBW rates differed by mother's racial/ethnic group. LBW rates were highest for newborns of Black or African American mothers (12.4 percent), Asian or Pacific Islander mothers (9.5 percent), and American Indian mothers (7.7 percent). Newborns of Hispanic or Latino and White non-Hispanic had the lowest LBW rates at 7.0 percent; based on data in **Table 1B-25**).

Figure 1B-20
First Trimester Prenatal Care by Mother's Race/Ethnicity,
Arizona Residents, 2017

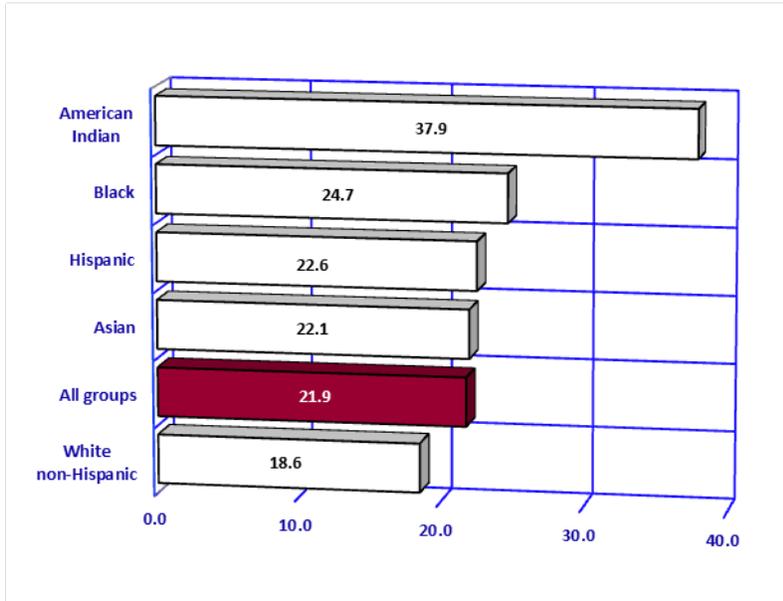

The percent of Arizona mothers giving birth who received early prenatal care (i.e., in the first trimester) has remained relatively stable from 2008 (79.4 percent) to 2013 (81.3 percent; **Table 1B-2**). In 2017, 68.3 percent of Arizona mothers initiated prenatal care during the first trimester. It should be noted that with the adoption of the 2003 revised U.S. birth certificate in 2014, trend analysis of the timing of prenatal care is compromised by significant changes in reporting of prenatal care initiation. Hence, the low proportion of women with timely entry to prenatal care in 2017 may be attributable for the most part to differences in reporting.

In Arizona, American Indian, Black or African American, and Hispanic or Latino mothers were least likely to begin prenatal care in the first trimester (**Figure 1B-20**). Timely entry to prenatal care was essentially reported among White non-Hispanic and Asian or Pacific Islander mothers based on data in (**Table 1B-25**).

1B. NATALITY: MATERNAL CHARACTERISTICS AND NEWBORN'S HEALTH

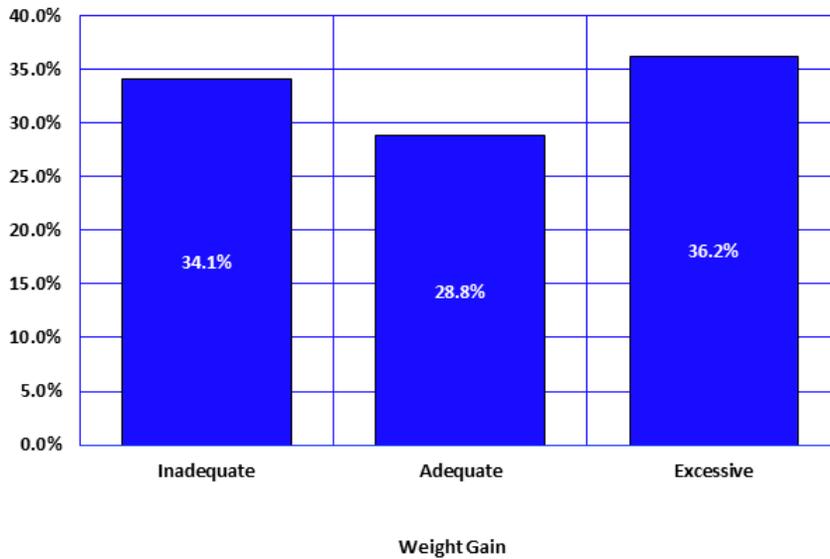

Figure 1B-21
Maternal Medical Risk Factors^a by Mother's Race/Ethnicity, Arizona, 2017

Note: ^a Births with medical risk factors reported per 100 births in specified group.

Maternal medical risk factors (such as, diabetes, hypertension, eclampsia, or sexually transmissible diseases) can contribute to serious pregnancy complications and infant deaths, if not treated properly. In 2017, with exception to White non-Hispanic mothers, all the mothers from the remaining race/ethnic groups recorded highest proportions of medical risk factors (**Figure 1B-21**).

Figure 1B-22
Low-Birthweight by Maternal Weight Gain during Pregnancy, Arizona, 2017

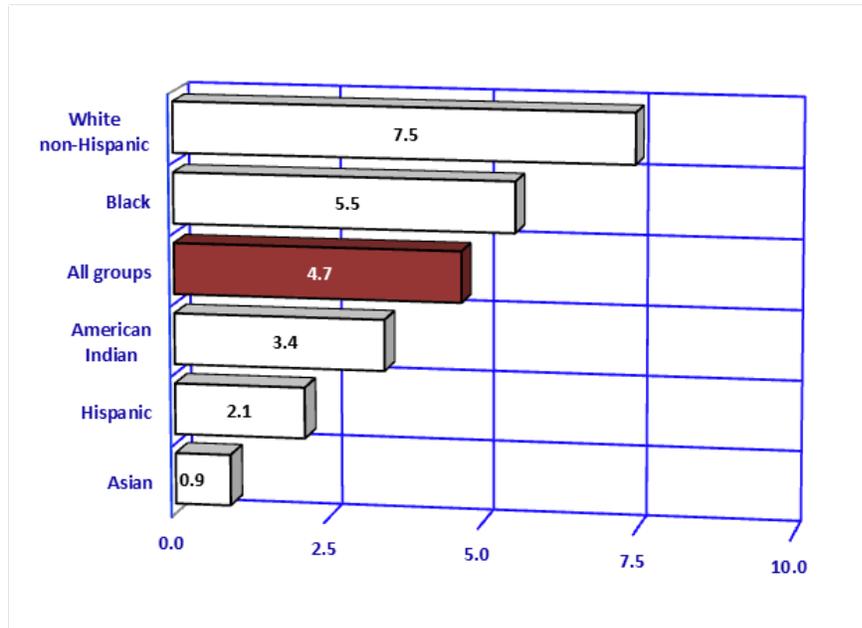

Maternal weight gain during pregnancy is a determinant of both fetal growth and birthweight. Insufficient or excessive weight gain during pregnancy can negatively influence outcomes of both mother and infant. Based on the Institute of Medicine guidelines, women who are of normal weight (body mass index or BMI 18.5-24.9) should gain 25-35 pounds during pregnancy. Underweight women (BMI <18.5) should aim to gain 28-40 pounds, while overweight women (BMI 25.0-29.9), and obese women (BMI ≥30.0) should gain 15-25 pounds and 11-20 pounds, respectively. Prior to the adoption of the 2003 revised birth certificate in 2014, it was not possible to analyze gestational weight gain in relation to mother's pre-pregnancy BMI. The revised birth certificate includes new fields (mother's height, pre-pregnancy weight, and weight at delivery) providing the opportunity to assess whether pregnancy weight gain is within the recommended range for the mother's BMI.

In 2017, the proportion of newborns with low birthweight was the lowest among mothers who gained the recommended amount of weight during pregnancy (**Figure 1B-22**).

1B. NATALITY: MATERNAL CHARACTERISTICS AND NEWBORN'S HEALTH

Figure 1B-23
Self-reported Tobacco Use during Pregnancy^a by Race/Ethnicity, Arizona, 2017

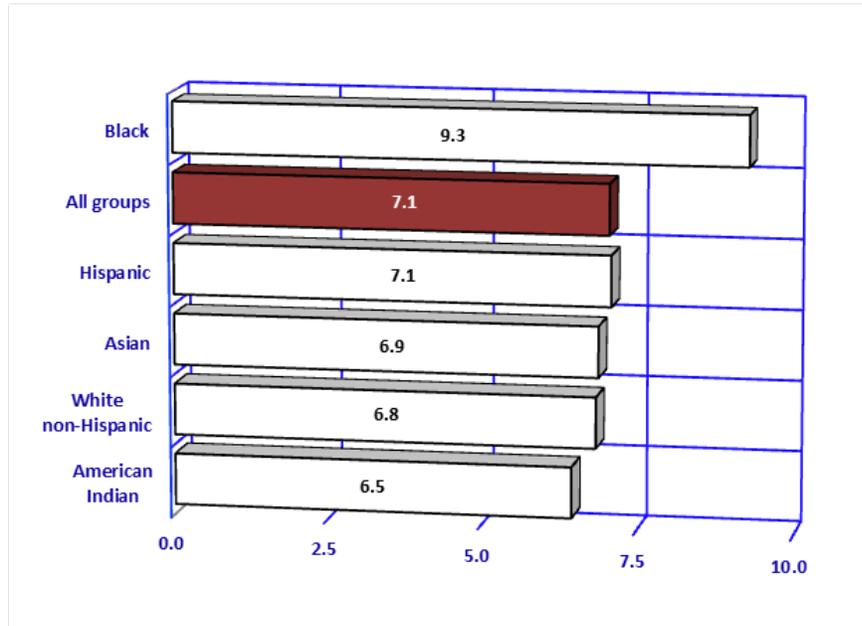

Cigarette smoking during pregnancy has been associated with reduced infant weight at birth, intrauterine growth retardation, and preterm births. Smoking during pregnancy was reported by 4.7 percent of women giving birth in 2017 (**Table 1B-25, Table 5B-30**), compared to 10.5 percent in 1989, when this information was first reported on Arizona birth certificates. It is unclear whether this decline means that women giving birth in Arizona are less likely to use tobacco during pregnancy or, perhaps, less likely to report it if they use. White non-Hispanic and Black mothers continued to be more likely to report smoking than American Indian, Hispanic, and Asian mothers (**Figure 1B-23**).

Note: ^a Mothers giving birth who reported tobacco use per 100 births in specified group.

Figure 1B-24
Rates of Admission to Newborn Intensive Care Units^a by Mother's Race/Ethnicity, Arizona, 2017

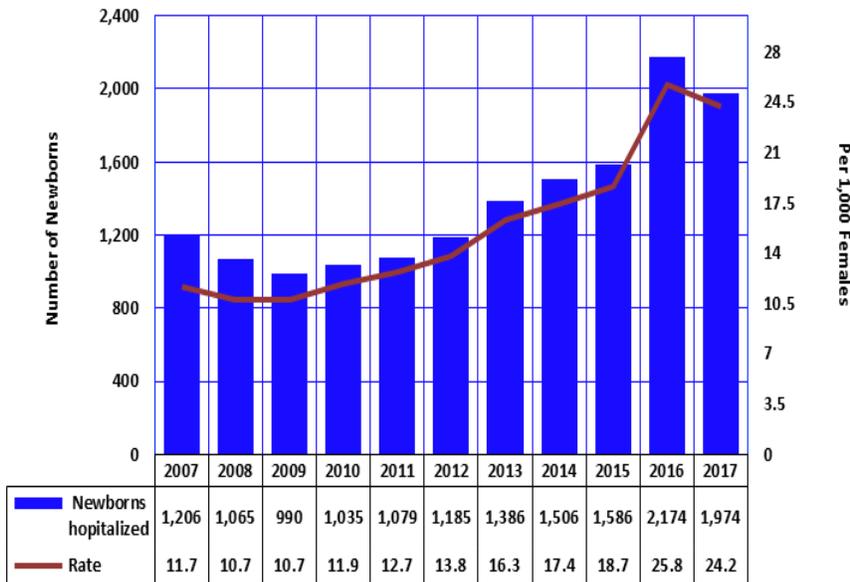

In 2017, 5,763 or 7.1 percent of newborns were admitted to newborn intensive care units (NICUs). Around 43.6 percent of the NICU admissions were low birthweight (LBW) babies. Prematurity, i.e., gestational age before 37 weeks captured more NICU admissions than did LBW, with 52.8 percent of NICU admissions being premature (based on data in **Table 1B-32**). The proportion of NICU admissions differed among racial/ethnic groups. In 2017 the rate of NICU admissions for Black or African American births was the highest among racial/ethnic groups (9.3 percent; **Table 1B-25**).

Note: ^a The number of newborns admitted to Intensive Care Units per 100 births in specified group.

1B. NATALITY: MATERNAL CHARACTERISTICS AND NEWBORN'S HEALTH

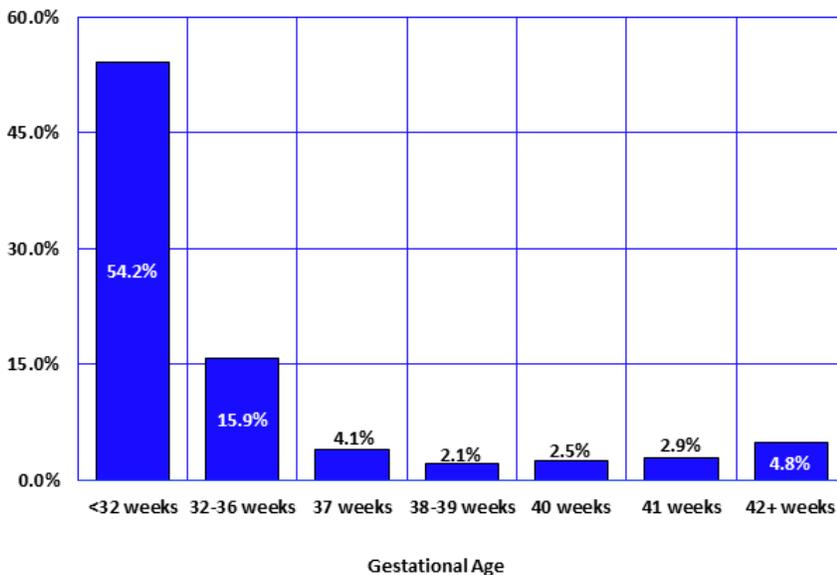

Figure 1B-25
Newborns Who Were Hospitalized after Birth because They Were Affected by Maternal Use of Drugs during Pregnancy, Arizona, 2007-2017

Note: Rate is the number of newborns admitted to Intensive Care Units per 100 births in specified group.

Information about maternal drug use during pregnancy is not reported on Arizona birth certificates. However, it can be obtained from the hospital discharge database. There are several diagnostic codes which identify exposure of fetus or newborn to specific noxious substances (such as narcotics, hallucinogenic agents, or cocaine) transmitted via placenta or breast milk. Following the 4 year-period of decline (2007-2009) in the number of newborns hospitalized after birth due to maternal drug use during pregnancy, the rate increased from 10.7/1,000 in 2009 to 24.2/1,000 in 2017.

Figure 1B-26
Abnormal Conditions of the Newborn by Gestational Age, Arizona, 2017

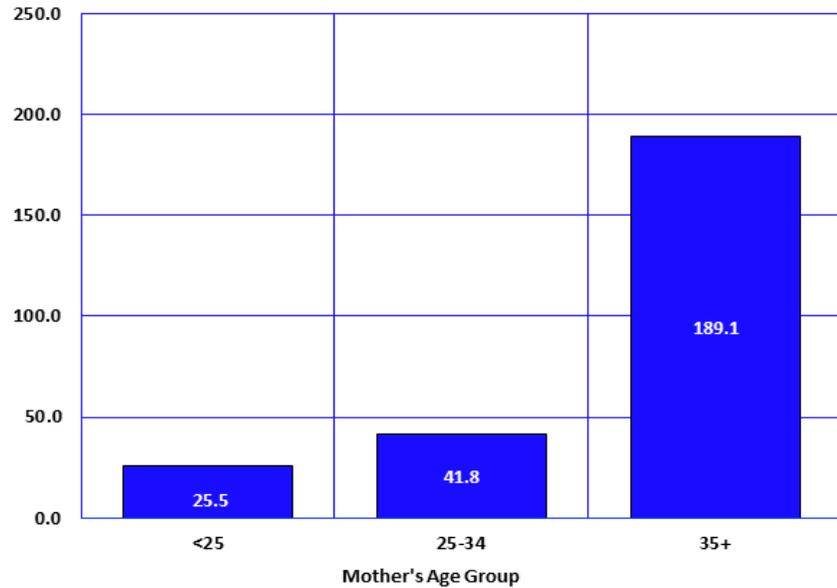

With the implementation of the revised birth certificate, three of the six specific abnormal conditions listed on the birth certificate have been reported most frequently: *assisted ventilation immediately after delivery, assisted ventilation for more than six hours, and suspected neonatal sepsis*. The rates of abnormal conditions are the highest among the very preterm (less than 32 weeks of gestation) and moderately preterm babies (32-36 weeks of gestation; **Figure 1B-26**).

1B. NATALITY: MATERNAL CHARACTERISTICS AND NEWBORN'S HEALTH

Figure 1B-27
The Incidence of Down Syndrome by Mother's Age Group, Arizona, 2017

Congenital anomalies (birth defects) are the leading cause of infant death in Arizona and nationally. They are also the cause of physical defects and metabolic diseases.

For various anomalies, rates vary widely with maternal age. For example, in 2017 as in prior years, the rate of Down's Syndrome, the most frequently recognized cause of intellectual disability, was substantially higher for births to mothers aged 35 years and older (**Figure 1B-27, Table 1B-33**). The incidence rate of 189.1 cases of Down's Syndrome per 100,000 births to women 35 years or older was 7.4 times greater than the incidence rate of 25.5 for women aged 24 years or younger.

Notes: ^a The number of births per 1,000 population.

^b The number of births per 1,000 women of childbearing age (15-44 years old).

^c The total fertility rate (TFR) is the sum of age group specific birth rates multiplied by the number of years in the age group (five years in this case). This rate estimates the number of children a hypothetical cohort of 1,000 women would bear if they all went through their childbearing years experiencing the same age-specific birth rates for a specified time period. For example, the Arizona 2017 TFR of 1,805 can be interpreted at the individual level as the average number of children a female resident would have by age 50 (1,805/1000 = 2 live births) if she were subjected throughout her life to the age-specific birth rates observed in 2017.

^d The sums of birth rates by 5-year age groups multiplied by the proportion of births that were female. The gross reproduction rate represents the average number of daughters born to a hypothetical cohort of 1,000 women if they experienced the age-specific birth rates observed in a given year throughout their childbearing years, and if none of the cohort was to die during her childbearing years. See Table 1B-2 for the annual proportions of births that were female in 2007-2017.

^e The number of births per 1,000 women in specified age group. For females under 15, the rate is calculated using the female population 10-14 years of age. For women over 44, the rate is calculated using the female population 45-49 years of age.

^f The U.S. rates are from the National Center for Health Statistics:

1C.

FETAL, PERINATAL, AND MATERNAL DEATHS

In Arizona, reportable fetal deaths are those after 20 completed weeks of gestation or if the fetus weighs more than 350 grams (*ARS 36-329; Arizona Administrative Code, R9-19-302*). In addition to spontaneous stillbirths, any induced termination of pregnancy at 20 or more weeks of gestation (or, if the gestation period is unknown, when the weight of the product of human conception is more than 350 grams) also requires the filing of a fetal death certificate.

1C. FETAL, PERINATAL, AND MATERNAL DEATHS

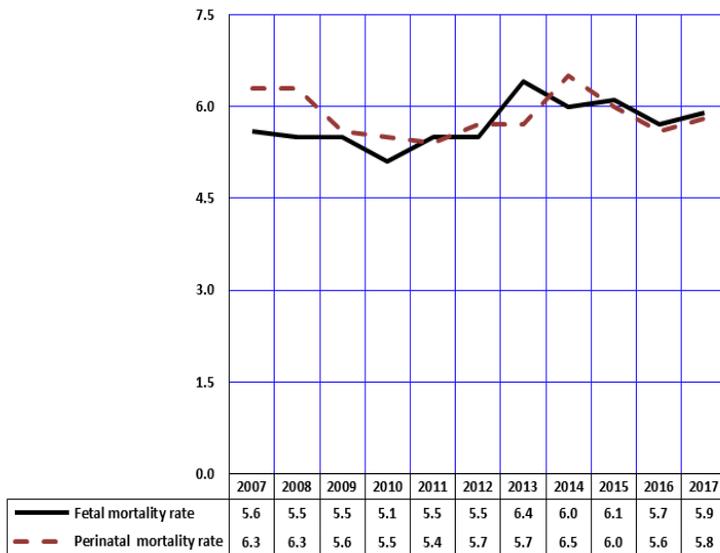

Figure 1C-1
Trends in Fetal Deaths, Arizona, 2007-2017

The number of all reported fetal deaths in Arizona (including late term abortions) in 2017 was 605, a 1.6 percent decrease from 2016 (**Figure 1C-1, Table 1C-3**). In 2017, the annual number of reportable spontaneous fetal losses decreased 1.0 percent from 486 in 2016 to 481 in 2017. (**Figure 1C-1, Table 1C-3**).

Note: All reported includes spontaneous and induced termination of pregnancy at 20 or more weeks of gestation or 350 grams or more and some stillbirths prior to 20 weeks and of any weight.

Figure 1C-2
Fetal^a and Perinatal^b Mortality Rates, Arizona, 2007-2017

The fetal mortality rate increased slightly from a rate of 5.7 deaths at 20 or more weeks of gestation per 1,000 live births in 2016 to a rate of 5.9 deaths in 2017. From 2015 to 2016, the total number of fetal losses dropped from 524 to 486*. The decline persisted until 2017 where 481 spontaneous fetal losses were recorded.

Perinatal mortality refers here to death of a fetus of at least 28 weeks gestational age, or of an infant less than 7 days old. The perinatal death rate per 1,000 live births has been below 6 deaths per 1,000 since 2009 then increased at 6.5 in 2014. The perinatal mortality rate of 5.8 in 2017 represented a slight increase from the 2016 rate (**Figure 1C-2, Table 1C-3**).

Early infant deaths accounted for 234 or 49.6 percent of the 472 perinatal deaths in 2017 (**Figure 1C-2, Table 1C-3**).

Notes: ^a Rate is the number of events per 1,000 live births and fetal deaths. ^b Infant deaths of less than 7 days and fetal deaths with gestation of 28 weeks or more, per 1,000 live births and fetal deaths.

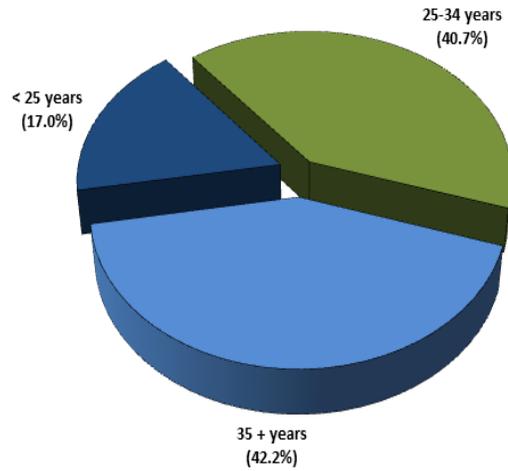

*A production error occurred in the previous report. The 2016 total number of fetal losses is the revised figure.

1C. FETAL, PERINATAL, AND MATERNAL DEATHS

Figure 1C-3
Percent of Death from Maternal Causes by Mother's Age Group, Arizona, 2007-2017

In 2017, 23 women giving birth were reported to have died from maternal causes (**Table 1C-1**). This represents a decline from 26 maternal deaths recorded in 2016*, but almost a threefold increase since 2015. The number of maternal deaths does not include all deaths occurring to pregnant women, but only those deaths assigned to causes related to or aggravated by pregnancy or pregnancy management.

Based on the total number of 135 maternal deaths from 2007 to 2017, women age 35 and older had the highest proportional contribution to maternal mortality followed by women age 25 - 34, and women age 24 and younger (**Figure 1C-3**).

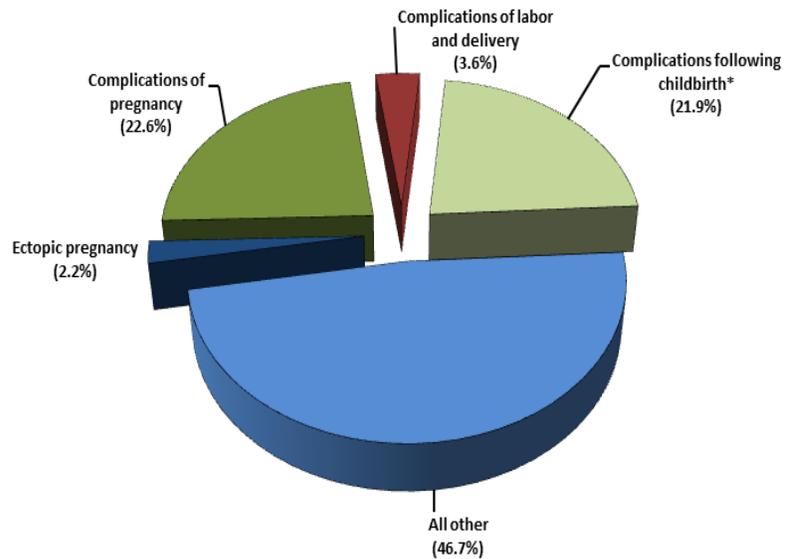

Note: The number of maternal deaths increased from 8 in 2015 to 26 in 2016.

*A production error occurred in the previous report. The 2016 total number of maternal deaths is the revised figure.

Figure 1C-4
Causes of Maternal Mortality^a, Arizona, 2007-2017

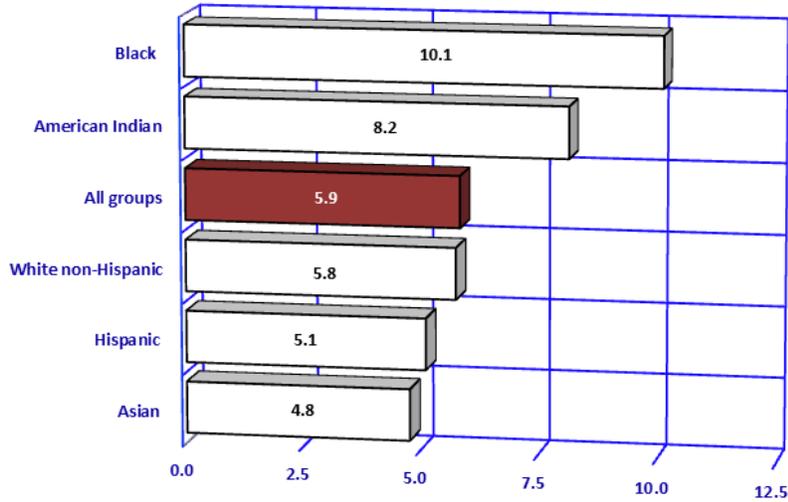

In the eleven-year period from 2007 to 2017, the major causes of maternal deaths in the state have included complications following childbirth (i.e. complications of the puerperium), complications mainly related to pregnancy, complications occurring in the course of labor and delivery, and ectopic pregnancy. All other possible causes of maternal death accounted for 46.7 percent of the maternal deaths from 2007 to 2017 (**Figure 1C-4**, **Table 1C-2**).

Notes: ^a Based on the total number of maternal deaths from 2007 to 2017; * Complications of the puerperium.

1C. FETAL, PERINATAL, AND MATERNAL DEATHS

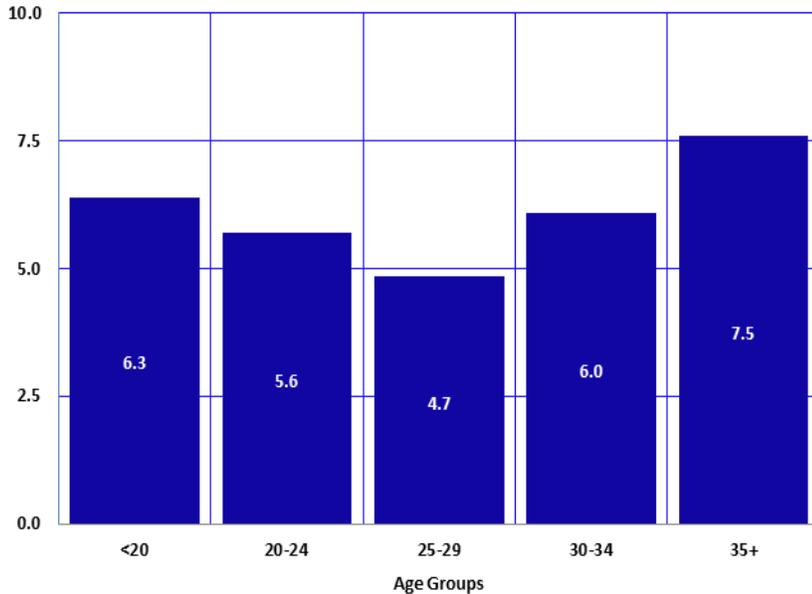

Figure 1C-5
Fetal Mortality Rates by Race/Ethnicity, Arizona, 2017

Fetal mortality rates vary by the race/ethnicity of the mother (**Figure 1C-5**). The fetal mortality rate for Black or African American women was 10.1 per 1,000 live births plus fetal deaths, the highest rate among the racial/ethnic groups. The fetal mortality rate was equally high for American Indian women (8.2), while the rates of White non-Hispanic (5.8), Hispanic or Latino (5.1), and Asian women (4.8) were below the state average.

Note: ^a Rate is the number of fetal deaths per 1,000 live births and fetal deaths.

Figure 1C-6
Fetal Mortality Rates by Mother's Age Group, Arizona, 2017

Fetal mortality rates vary by maternal age (**Figure 1C-6**). In 2017 fetal mortality rates were lowest for women aged 25-29 years and highest for women aged 35 years and older. The fetal mortality rate for mothers aged 35 and older decreased by 13.8 percent from 2016.

Note: ^a Rate is the number of fetal deaths per 1,000 live births and fetal deaths.

Notes: * Cell suppressed due to non-zero count less than 6; ^a Includes spontaneous terminations of pregnancy at 20 or more weeks of gestation (or if gestational age is unknown, the deaths of fetuses of at least 350 grams in weight), excludes abortions; ^b For statistical purposes, fetal deaths are classified according to gestational age; a death that occurs at 20 or more weeks of gestation constitutes a fetal death, and after 28 weeks it is considered a late fetal death.

1D.

ABORTIONS

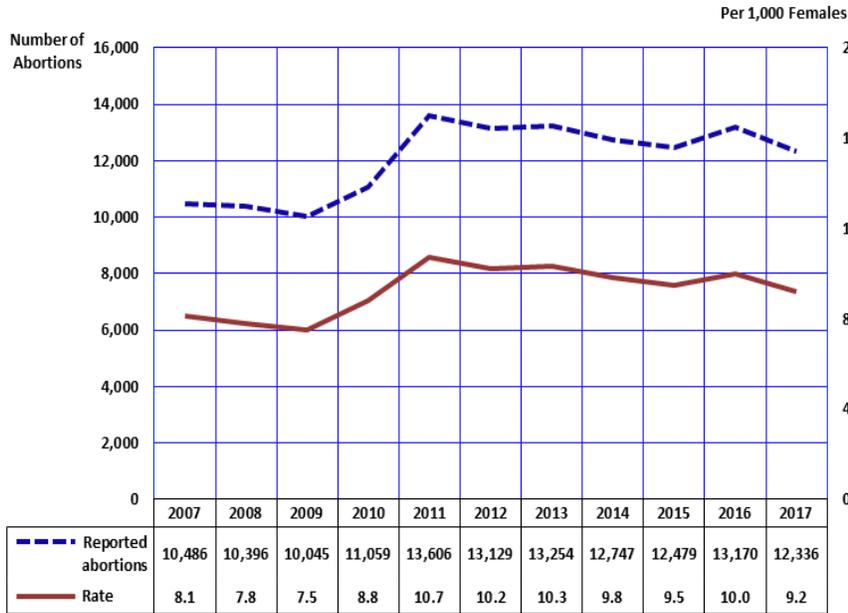

In July 1976, the Arizona Department of Health Services (ADHS) began an Abortion Surveillance Program (*Arizona Administrative Code, R9-19-302D*, as authorized by the *Arizona Revised Statute 36-344*). The program required the reporting of induced terminations of pregnancy performed in hospitals, outpatient treatment centers, and physicians' offices throughout the State.

In 2010, SB1304 was passed by the legislature that statutorily required the reporting of abortions and treatment of complications associated with abortions. In addition, the office of the Courts were required to report the number of petitions received by the court for authorization to perform abortions on unemancipated minors as prescribed in Arizona Revised Statutes §36-2152. The collection of this information began on July 29, 2010.

Based on the information collected on race/ethnicity in the abortion reporting system, the racial/ethnic groups described in this section differ from that of other sections. In 2017, 4.7 percent (577) of abortion records had race and ethnicity identified as unknown, and 1.8 percent (216) of abortion records had two or more racial/ethnic groups identified. Due to the proportion of information on race/ethnicity that could not be categorized by the five racial/ethnic groups used through this report, this section reports numbers for records with unknown or multiple race information as separate groups.

1D. ABORTIONS

Figure 1D-1
Number of Reported Abortions and Abortion Rates^a by Year, Arizona Residents, 2007-2017

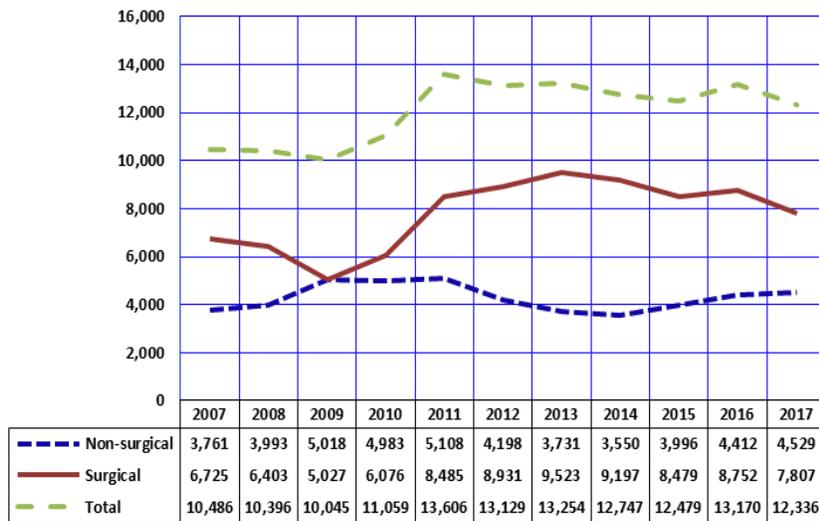

In calendar year 2017, the Arizona Department of Health Services received 12,336 reports of abortions obtained by Arizona residents, 834 less than the 13,170 reported in 2016 (**Figure 1-D1, Table 1D-1**).

There were 12,301 abortions in non-hospital clinics (**Table 1D-1**). Hospitals accounted for 31 abortion procedures, with less than 6 procedures being performed outside of clinics and hospitals.

Ninety-one percent of all reported abortions occurred at or before 13 weeks of pregnancy. Few reported abortions occurred after 14 or more weeks of gestation: 8.0 percent at 14 weeks or more (percentages based on data in **Table 1D-3**).

Notes: ^a Number of abortions per 1,000 females 15-44 years old. The sharp increase in number of reported abortions and rates was due to enhanced surveillance as noted in the abortion report.

Figure 1D-2
Trends in the Number of Surgical and Non-Surgical Abortions by Year, Arizona Residents, 2007-2017

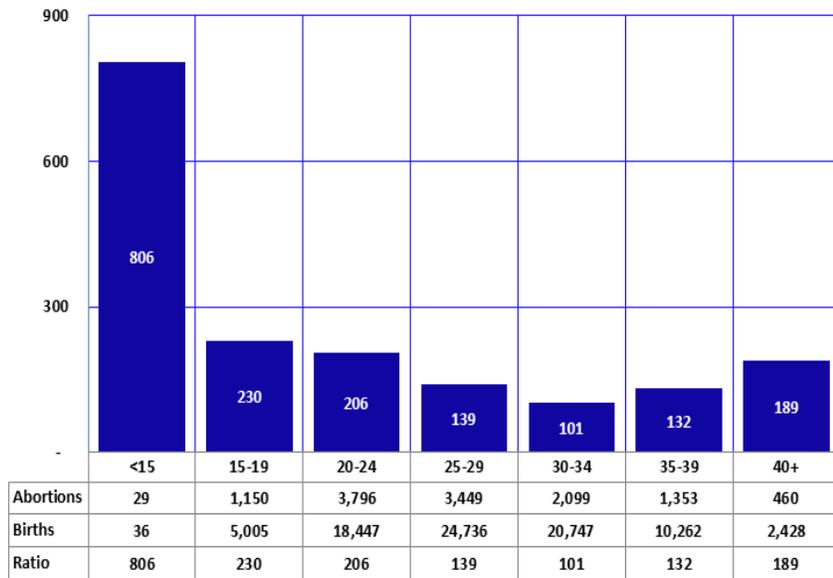

The rate of induced terminations of pregnancy per 1,000 female residents aged 15-44 decreased from 10.0 in 2016 to 9.2 in 2017 (**Table 1D-1**).

Trends in the percent of abortions conducted through surgical and non-surgical from 2007 to 2017 indicate shifting practices in methods used to complete abortions. In 2007, 64.1 percent of all abortion procedures were surgical procedures. By 2009, the number of abortions performed by surgical versus non-surgical means was nearly equal. Since then, the proportion of abortions conducted through surgical means has again increased, with 63.3 percent of all abortion procedures conducted in 2017 being surgical procedures.

1D. ABORTIONS

Figure 1D-3
Abortion Ratios^a by Age Group, Arizona Residents, 2017

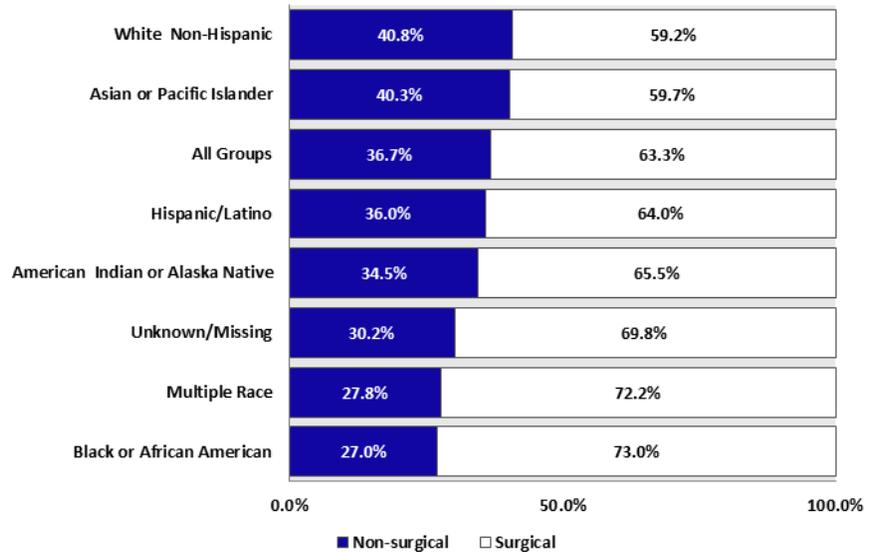

Abortion ratios (the number of abortions per 1,000 live births in each age group) vary by age at reported termination of pregnancy. Ratios tend to be higher at the extremes of the age distribution of the childbearing period, i.e., among women under age 15 and those aged 40 years or older (**Figure-1D-3**).

A comparison of abortion ratios by race/ethnicity is provided in **Table 1D-2**.

Note: ^a Number of reported abortions per 1,000 live births in specified group.

Figure 1D-4
Proportional Contribution of Non-Surgical^a and Surgical Abortions by Race/Ethnicity, Arizona Residents, 2017

In 2017 non-surgical (also called “medical”) abortions made up 36.7 percent of all procedures reported in Arizona. Among Asians and White non-Hispanics, the proportion of non-surgical abortions exceeded the average for all groups (**Figure 1D-4**). The proportion of non-surgical abortions among Black or African American women was the lowest among racial/ethnic groups.

Notes: ^a Non-surgical: Mifepristone, Methotrexate, RU486, etc.; Reporting changes related to race/ethnicity makes comparisons with previous years difficult.

Notes: ^a Number of resident abortions performed in Arizona per 1,000 resident live births in specified race/ethnicity group; ^b Proportion of total abortions by ethnicity and/or race represented as a percentage. Percentages are calculated using the total number of reported abortions as the denominator and the number of reported abortions for a specific ethnicity and/or race as the numerator. Percents do not add up to a 100 due to rounding errors, multiple race and unknown ethnicity/race categories; ^c Calculated using the number of abortions obtained by women, ages 15-44 in a given race and/or ethnic group per 1,000 women in the same group; ^d Calculated using the number of abortions per 1,000 live births; ^e Beginning 2011, rates and ratios should be interpreted with caution due to the addition of the Multiple Race and Unknown categories. Single race selections are the best estimates for rates and ratios.
