- **CHILDHOOD MORTALITY**
- **ADOLESCENT MORTALITY**
- **YOUNG ADULT MORTALITY**
- **MIDDLE-AGED ADULT MORTALITY**
- **ELDERLY MORTALITY**

2D. PATTERNS OF PREMATURE MORTALITY

2A.

TOTAL MORTALITY

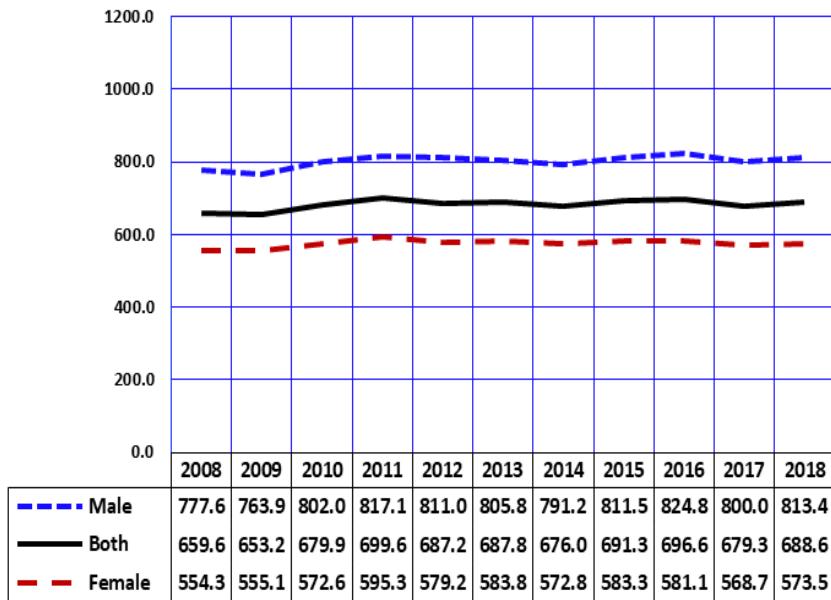

The total number of deaths from all causes among Arizona residents increased by 3.4 percent from 2017 (57,261) to 2018 (59,206; **Table 2A-1**). The age-adjusted mortality rate for all causes of death also increased from 679.3 /100,000 in 2017 to 688.6/100,000 in 2018. When considering race/ethnicity, the biggest increase in age-adjusted mortality occurred among Blacks or African Americans (5.4 percent) and the lowest was recorded among White non-Hispanics (1.3 percent).

Between 2017 and 2018, the increase in mortality did not affect all leading causes of death. A reduction in the number of deaths was recorded for septicemia (17.1 percent), essential (primary) hypertension and hypertensive renal disease (8.8 percent), homicide (3.3 percent) and Alzheimer's disease (1.3 percent).

There were some disparities by gender and race/ethnicity for most selected causes of death. Between 2017 and 2018, not all subgroups (based on gender and race/ethnicity) witnessed an increased in cerebrovascular mortality. While the highest increases in mortality due to cerebrovascular diseases was among Asian females (32.5 percent) and American Indian females (30.2 percent), a decline in mortality due to cerebrovascular diseases was recorded among both Black females (12.7 percent) and males (6.4 percent), Hispanic males (4.7 percent), and Asian males (3.7 percent) during 2017- 2018. In terms of mortality due to diabetes, the overall mortality rate for both males and females decreased from 2017 (23.8/100,000) to 2018 (23.0/100,000) following a period of stability during 2011 to 2014 (**Table 2B-2**). The decrease in deaths due to diabetes between 2017 and 2018 affected all race/ethnic groups, except Black or African Americans who witnessed an increase of 6.5 percent in their age adjusted diabetes mortality rates.

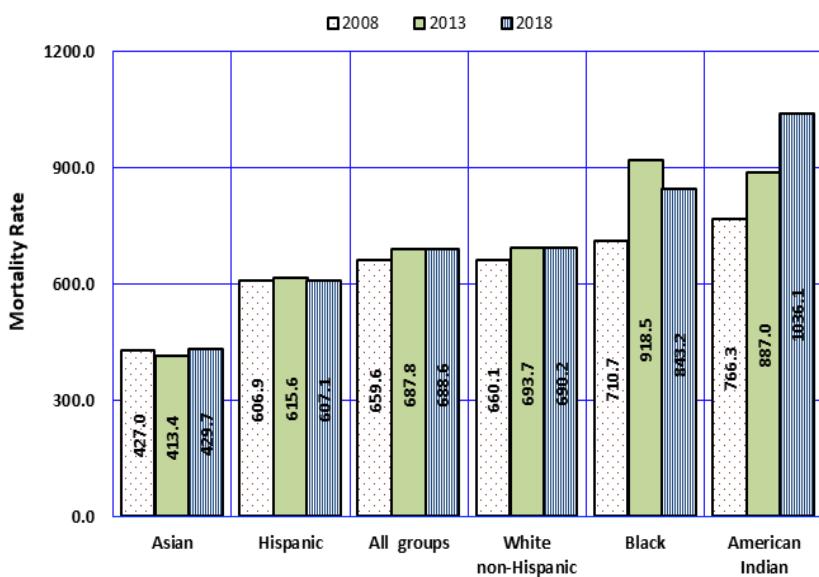

2A. TOTAL MORTALITY

Figure 2A-1
Age-adjusted Mortality Rates^a for all Causes by Gender and Year,
Arizona, 2008-2018

Note: ^a Number of deaths per 100,000 persons (adjusted to the 2000 standard U.S. population).

Figure 2A-2
Age-adjusted Mortality Rates^a for all Causes by Race/Ethnicity and Year,
Arizona Residents, 2008, 2013, and 2018

Note: ^a Number of deaths per 100,000 persons (adjusted to the 2000 standard U.S. population).

The age-adjusted mortality rates discussed below are based on the year 2000 population standard. All mortality rates in sections 2A and 2B are age-adjusted. A detailed explanation of the age-adjustment of mortality rates is given in the **Technical Notes**.

The total age-adjusted mortality rate increased by 1.4 percent, from 679.3 deaths per 100,000 population in 2017 to 688.6 deaths in 2018 (**Figure 2A-1, Table 2B-2**). Over this period, the age-adjusted mortality rates increased for both males and females.

The gap between male and female mortality rates increased between 2008 and 2018. The male age-adjusted mortality rate was 40.3 percent greater than the female age-adjusted mortality rate in 2008, but 41.8 percent greater in 2018.

The 2018 age-adjusted death rates for the major racial/ethnic groups were as follows: for Asian or Pacific Islander, 429.7 deaths per 100,000 population; Hispanic or Latino, 607.1; White non-Hispanic, 690.2; Black or African American, 843.2; and American Indian or Alaska Native, 1036.1 (**Figure 2A-2, Table 2B-4**).

In 2018, as in 2008 and 2013, American Indians and Blacks had higher total mortality rates than White non-Hispanics, Hispanics, and Asians. The total mortality rates for Asians were lower than the rates of both White non-Hispanics and Hispanics in 2008, 2013, and 2018.

2A. TOTAL MORTALITY

Figure 2A-3
Percent of Annual Deaths by Month of Occurrence and Residence Status, Arizona, 2018

If there was no monthly variation in proportional contribution to total annual deaths, 8.3 percent (100/12) of deaths should occur monthly. However, when the monthly distribution of resident deaths is examined, January (10.5 percent), March (9.0 percent), and December (8.8 percent), were higher in 2018 from the expected value (**Figure 2A-3**). September was the month with the lowest proportional contributions to the total annual deaths among Arizona residents (AZR).

The majority of the 3,482 non-residents who died in Arizona during 2018 did so during the months of January, March, and February.

August was the month with the lowest percent contribution (6.8 percent) to the annual death among out-of-State residents (OSR) who died in Arizona.

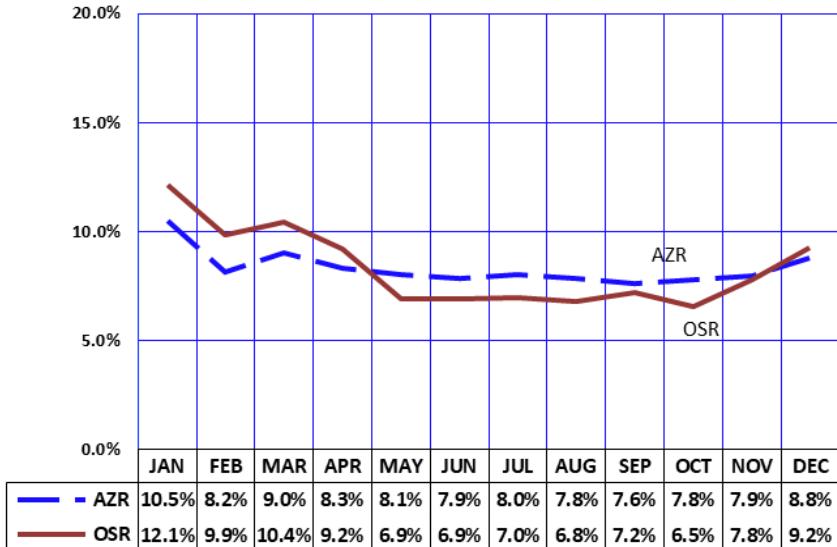

Figure 2A-4
Percentage of Deaths for which Autopsies were Reported by Race/Ethnicity and Year, Arizona Residents, 2008-2018

Autopsies were reported as performed on 5,691 decedents, or 9.6 percent of the deaths that occurred among Arizona residents in 2018. From 2008 – 2018, the percentage of deaths for which autopsies were reported varied from 9.8 percent in 2008, to a low of 8.6 percent in 2011 and 2012, a high of 10.1 percent in 2016, then 9.6 percent in 2018.

The percentage autopsied varies by the decedent's demographic characteristics. By race/ethnicity (**Figure 2A-4**) the percentage autopsied was the lowest for White non-Hispanic than for other racial/ethnic groups. The prevalence of autopsies was substantially greater among American Indian, Black, and Hispanic or Latino sub-populations. A substantial portion of the differential in the use of autopsy by race/ethnicity reflects differences in the age and manner of death. For example, autopsies tend to be more common at younger ages and for deaths by homicide, suicide, accidents, and undetermined manner.

2B.

LEADING CAUSES OF DEATH

In 2010, the Office of Vital Records (OVR) of the Arizona Department of Health Services implemented the new (version 2003) Standard U.S. death certificate. The new certificate added several new questions: 1) whether tobacco use contributed to the death, and 2) whether, if the decedent was a female, the death was "pregnancy-associated" (defined as death from any cause during pregnancy or within one calendar year of delivery or pregnancy termination).

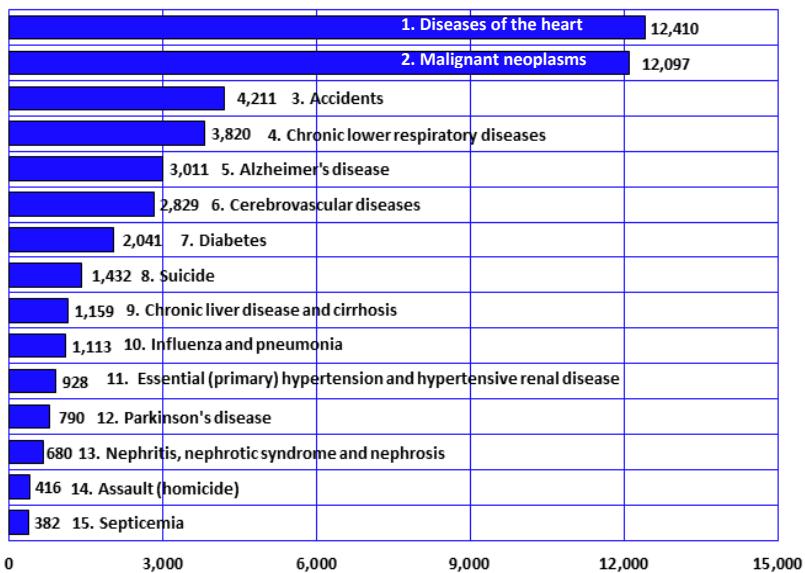

The death certificate now includes a new classification of the decedent's racial/ethnic status, consistent with the revised federal standards for collecting and reporting racial and ethnic status. These standards were published in the Federal Register on October 30, 1997, as "Revisions to the Standards for the Classification of Federal Data on Race and Ethnicity." The revised standards are available on the OMB (the Office of Management and Budget) web-site at: <https://www.whitehouse.gov/omb>.

There are now 15 racial categories (including Guamanian or Chamorro; Samoan or Native Hawaiian) to choose from. It is also permitted to indicate more than one race for a decedent. To create frequency counts of race and ethnicity that were adequate to compute statistically reliable mortality rates, race was "bridged", or essentially collapsed into 5 categories; White non-Hispanic, Hispanic or Latino, Black or African American, Native American or Alaska Native, and Asian or Pacific Islander. When an individual was identified as both Hispanic and any other race, that person was added to the racial/ethnic group with the lowest population. For example, a person identified as both White and Hispanic would be coded as Hispanic, where a person identified as American Indian and Hispanic would be coded as American Indian. Please refer to the technical appendix for further explanation of the racial bridging used in this report.

2B. LEADING CAUSES OF DEATH

Figure 2B-1A
Leading Causes of Death among Arizona Residents in 2018

BASED ON THE NUMBER OF DEATHS DUE TO THE UNDERLYING CAUSE:

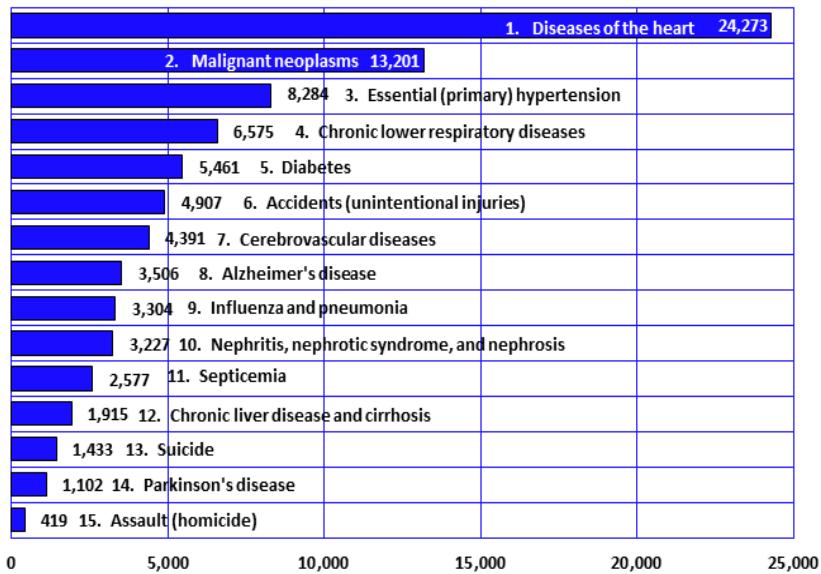

Based on the number of deaths (but not age-adjusted mortality rate), the leading underlying cause of death to Arizona residents in 2018 was *heart disease* (12,410 or 21.0 percent of all deaths), closely followed by *cancer*, which accounted for 12,097 or 20.4 percent of deaths (**Figure 2B-1A, Table 2B-1, Table 5E-14**).

The third leading cause of death, *accidents (unintentional injuries)*, accounted for 4,211 or 7.1 percent of total deaths. Deaths due to *chronic lower respiratory diseases* ranked fourth in 2018, with 3,820 resident deaths reported. Deaths due to *Alzheimer's disease* ranked fifth in 2018, with 3,011 resident deaths reported. Together, these five causes accounted for 60.0 percent of total deaths in 2018. The fifteen leading causes accounted for 79.9 percent of all deaths among Arizona residents.

Figure 2B-1B
Leading Causes of Death among Arizona Residents in 2018

BASED ON THE NUMBER OF DEATHS DUE TO ANY MENTION OF A CAUSE:

For the purpose of mortality statistics, every death is attributed to one underlying condition or underlying cause of death. The underlying cause is defined as the disease or injury that initiated the chain of events leading directly to death. It is selected from up to 20 causes and conditions entered by the physician on the death certificate. The totality of all these conditions is known as multiple cause of death.

In addition to 12,410 deaths that had diseases of the heart assigned as the underlying cause, another 11,863 deaths had diseases of the heart assigned as a secondary cause of death. The sum of these two counts (24,273, **Figure 2B-1B**) is the total number of deaths that had any mention of diseases of the heart on the 2018 death certificates. The ranking based on any mention of the 15 diagnostic categories is different from ranking of the leading causes of death based on the underlying cause. In particular, *Essential hypertension* ranked 11th as the underlying cause but ranked 3rd when any mention of it was counted.

2B. LEADING CAUSES OF DEATH Five Leading Causes by Gender

It is important to note that (**Figures 2B-2, 2B-3, 2B-4, and 2B-5**) are based on the age-adjusted mortality rates and not on the number of deaths.

In 2018, diseases of the heart were the leading cause of death for White non-Hispanics and Blacks while it was the second leading cause of death for the remaining race/ethnic groups. Cancer was the second leading cause of death for White non-Hispanics, and Black or African Americans, but ranked first for Hispanics and Asians. Unintentional injury was among the third leading cause of death for White non-Hispanics, Hispanics, and Blacks, while it ranked first among American Indians and fourth among Asians. (**Figure 2B-2, Table 2B-4**).

In 2018, chronic lower respiratory diseases were the fourth leading cause of death specific to White non-Hispanics. In parallel, chronic liver disease and cirrhosis ranked fourth among the leading causes of death for American Indians alone. Alzheimer's disease was the fifth leading cause of death for all subgroups, except among Hispanics (cerebrovascular diseases) and American Indians (diabetes). (**Table 2B-4**).

Figure 2B-2
Age-adjusted Mortality Rates^a for the Five Leading Causes of Death for Both Genders by Race/Ethnicity, Arizona, 2018

Rank	White non-Hispanic	Hispanic or Latino	Black or African American	American Indian or Alaska Native	Asian or Pacific Islander
1	Diseases of heart 144.3	Cancer 118.7	Diseases of heart 166.4	Unintentional injury 144.5	Cancer 102.7
2	Cancer 140.2	Diseases of heart 116.0	Cancer 156.7	Diseases of heart 129.9	Diseases of heart 86.0
3	Unintentional injury 56.3	Unintentional injury 44.5	Unintentional injury 57.6	Cancer 115.3	Cerebro-vascular diseases 27.9
4	Chronic lower respiratory diseases 48.0	Diabetes 35.0	Diabetes 48.9	Chronic liver disease and cirrhosis 88.8	Unintentional injury 24.9
5	Alzheimer's disease 35.1	Cerebro-vascular diseases 34.6	Alzheimer's disease 45.1	Diabetes 73.6	Alzheimer's disease 19.8

Note: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

Figure 2B-3
Age-adjusted Mortality Rates^a for the Five Leading Causes of Death by Race/Ethnicity among Females, Arizona, 2018

Rank	White non-Hispanic	Hispanic or Latino	Black or African American	American Indian or Alaska Native	Asian or Pacific Islander
1	Cancer 118.9	Cancer 99.6	Diseases of heart 149.5	Diseases of heart 108.6	Cancer 96.7
2	Diseases of heart 111.4	Diseases of heart 90.1	Cancer 131.2	Cancer 92.6	Diseases of heart 68.5
3	Chronic lower respiratory diseases 46.8	Cerebro-vascular diseases 32.6	Alzheimer's disease 49.9	Chronic liver disease and cirrhosis 77.1	Cerebro-vascular diseases 29.2
4	Alzheimer's disease 41.3	Alzheimer's disease 32.1	Diabetes 44.5	Unintentional injury 74.5	Alzheimer's disease 26.6
5	Unintentional injury 37.8	Diabetes 27.4	Cerebro-vascular diseases 43.9	Diabetes 59.1	Unintentional injury 18.7

Note: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

2B. LEADING CAUSES OF DEATH Five Leading Causes by Gender

Figure 2B-4
Age-adjusted Mortality Rates^a for the Five Leading Causes of Death by Race/Ethnicity among Males, Arizona, 2018

Rank	White non-Hispanic	Hispanic or Latino	Black or African American	American Indian or Alaska Native	Asian or Pacific Islander
1	Diseases of heart 181.1	Diseases of heart 147.4	Cancer 193.4	Unintentional injury 224.0	Diseases of heart 112.9
2	Cancer 165.7	Cancer 144.3	Diseases of heart 185.8	Diseases of heart 156.0	Cancer 112.0
3	Unintentional injury 74.7	Unintentional injury 63.5	Unintentional injury 80.4	Cancer 149.6	Unintentional injury 31.5
4	Chronic lower respiratory diseases 49.2	Diabetes 44.0	Diabetes 54.7	Chronic liver disease and cirrhosis 101.9	Diabetes 25.9
5	Intentional Self-harm Suicide 37.5	Cerebro-vascular diseases 36.3	Cerebro-vascular diseases 42.7	Diabetes 92.4	Cerebro-vascular diseases 25.2

Note: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

Figure 2B-5
Age-adjusted Mortality Rates^a for the Five Leading Causes of Death by Gender in Urban^b and Rural Areas, Arizona, 2018

Rank	Urban male	Urban female	Rural male	Rural female
1	Diseases of heart 168.2	Cancer 113.1	Diseases of heart 208.0	Diseases of heart 119.4
2	Cancer 157.5	Diseases of heart 106.4	Cancer 176.9	Cancer 119.3
3	Unintentional injury 71.3	Alzheimer's disease 39.8	Unintentional injury 102.6	Chronic lower respiratory diseases 52.7
4	Chronic lower respiratory diseases 41.4	Chronic lower respiratory diseases 38.0	Chronic lower respiratory diseases 57.4	Alzheimer's disease 39.3
5	Cerebrovascular diseases 31.8	Unintentional injury 35.3	Intentional Self-harm (suicide) 51.4	Unintentional injury 36.0

Notes: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard; ^b Urban = Maricopa, Pima, Pinal, and Yuma counties. The remaining counties comprise Arizona's rural areas.

Based on age-adjusted mortality rates, diseases of the heart followed by cancer were the two leading causes of death among males for all the race/ethnic groups except Black and American Indian males (**Figure 2B-4; Table 2B-4**). Unintentional injury ranked third position for all race/ethnic groups, except among American Indians.

In 2018, based on the age-adjusted mortality rates, diabetes was among the fourth leading causes of death for Hispanic, Black, and Asian males, while chronic lower respiratory diseases, and chronic liver disease ranked fourth for White non-Hispanic males and American Indian males, respectively.

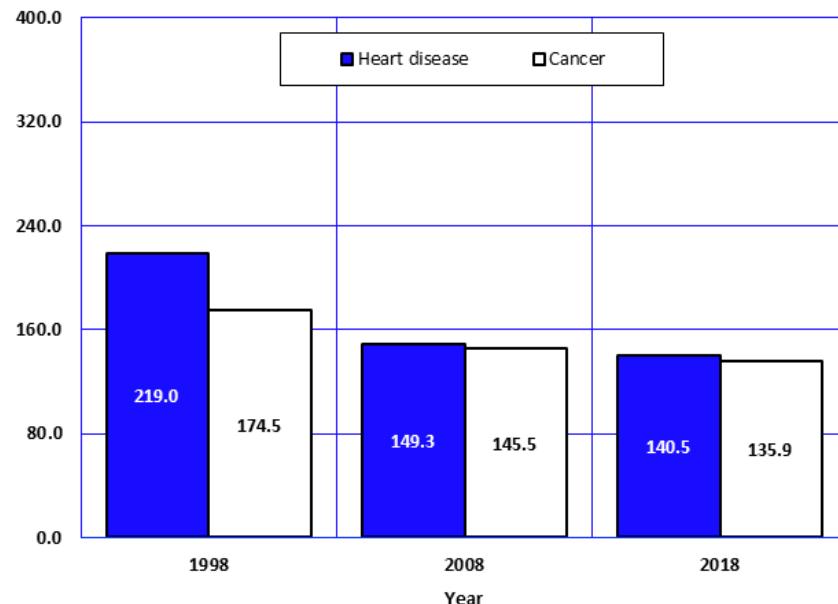

Ranking fifth was suicide (White males) cerebrovascular diseases (Hispanic, Black and Asian males) and diabetes (American Indian males).

In 2018, the profile of the leading causes of death differed by gender for residents of the urban (Maricopa, Pima, Pinal, and Yuma counties) and rural (all the remaining counties) areas of the state (**Figure 2B-5, Table 2B-5**). Diseases of the heart exceeded cancer as the leading causes of death among urban males and rural males and females. Unintentional injury placed third among the leading cause for males but fifth for females, regardless of area of residence.

Alzheimer's disease was the third leading cause of death among urban females but the fourth among rural females. Chronic lower respiratory diseases were the fourth leading cause of death in urban areas and among rural males, while it was the third among rural females. Among the fifth leading cause of death, cerebrovascular diseases were specific to urban males while suicide was specific to rural males.

2B. LEADING CAUSES OF DEATH Diseases of heart and malignant neoplasm (cancer)

Figure 2B-6
**Comparison of Age-adjusted Mortality Rates^a for Heart Disease and Cancer
(Malignant Neoplasm), Arizona, 1998, 2008, and 2018**

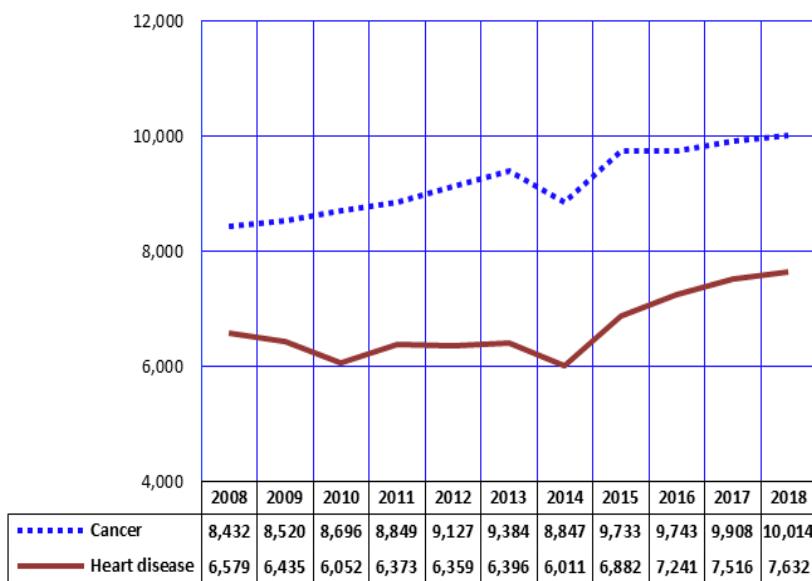

The age-adjusted mortality rate for diseases of the heart decreased by 35.8 percent from 219.0 deaths per 100,000 population in 1998 to 140.5/100,000 in 2018 (**Figure 2B-6**). The age-adjusted mortality rate for cancer declined less, by 22.1 percent, from 1998-2018. In Arizona, the relative risk of death from heart disease versus cancer changed from 25.5 percent greater in 1998 to 3.4 percent less in 2018.

In 2008, 350 more Arizonans died from diseases of the heart than cancer (**Table 2B-1**). In 2018, the number of deaths due to diseases of the heart exceeded by 313 cases (**Table 2B-4**).

Note: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

Figure 2B-7
**Number of Deaths from Heart Disease and Cancer among
Arizonans 0-84 Years, 2008-2018**

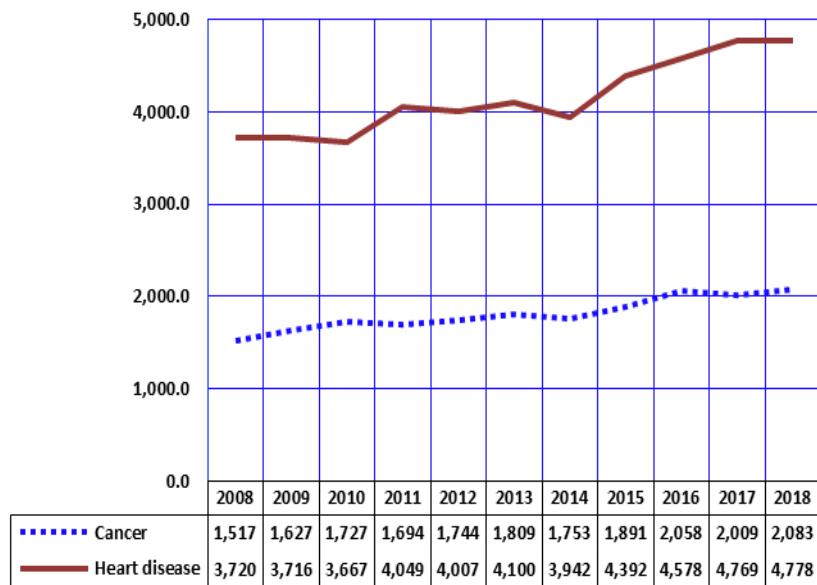

For the past several years, cancer has been the number one cause of death among Arizonans aged 0-84 years (**Figure 2B-7**). Beginning in 1996, the annual number of cancer deaths exceeded the number of deaths from heart disease. In 2018, 2,382 more Arizonans 0-84 years old died from cancer (10,014) than heart disease (7,632).

Note: 2008 counts for cancer and heart disease were updated due to misclassification of 2008 death records.

2B. LEADING CAUSES OF DEATH Diseases of heart and malignant neoplasm (cancer)

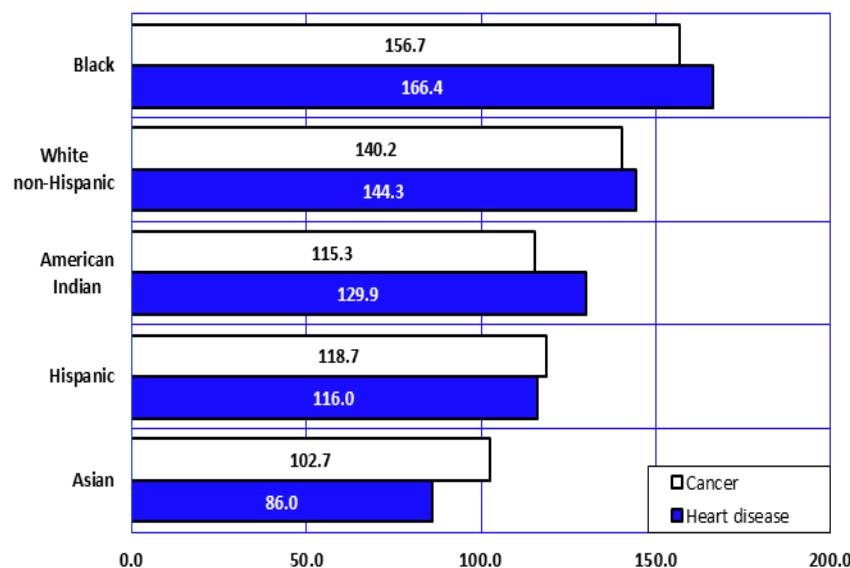

Figure 2B-8
Deaths from Heart Disease and Cancer among Arizonans 85+, 2008-2018

Among Arizonans age 85 and over, heart disease is the number one leading cause of death by a wide margin. In 2018, adults aged 85 and over accounted for 17.2 percent of all deaths from cancer but 38.5 percent of all deaths from heart disease. In 2018, the median age at death for heart disease was 80 years (**Table 2D-3**); and a minority of deaths (44.8 percent, **Table 2D-4**) were premature, i.e., before reaching the expected years of life at birth for all U.S. residents (78.8 years).

However, from 2008 to 2018, the number of deaths from cancer increased by 37.3 percent among Arizonans 85 years or older, more than the increase observed in diseases of the heart (28.4 percent increase).

Figure 2B-9
Age-adjusted Mortality Rates^a for Heart Disease and Cancer by Race/Ethnicity, Arizona, 2018

In Arizona, Black or African Americans were 1.9 times more likely to die from diseases of the heart and 1.5 times more likely to die from malignant neoplasms in 2018 than Asians, the group with the lowest risk of each respective cause of death (**Figure 2B-9, Table 2B-4**). Compared to Asians, White non-Hispanic Arizonans were 1.7 times more likely to die of heart disease and 1.4 times more likely to die of cancer.

In 2018, the relative risk of death from heart disease exceeded cancer mortality risk (**Table 2B-3**) for all the racial/ethnic groups, except for Hispanics and Asians.

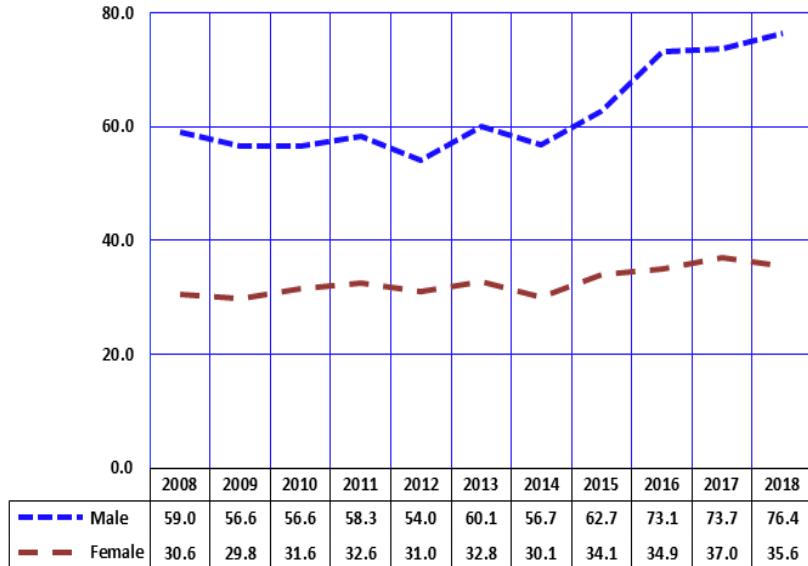

Note: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

2B. LEADING CAUSES OF DEATH Accidents (unintentional injury)

Figure 2B-10
Age-adjusted Mortality Rates^a for Accidents (Unintentional Injuries) by Gender and Year, Arizona, 2008-2018

The number of deaths from unintentional injuries increased by 3.1 percent from 4,085 in 2017 to 4,211 in 2018 (**Table 2B-1**). In 2018, based on age-adjusted mortality rates, accidents ranked third as a leading cause of death for males and fifth for females (**Table 2B-4**). From 2017 to 2018, the age-adjusted mortality rate for accidents increased 3.7 percent for males while it decreased 3.8 percent for females (**Figure 2B-10**).

In 2018, 1,032 deaths were caused by motor vehicle accidents, an increase of 5.4 percent from 2017. Heat induced mortality has seen a reduction of 13.0 percent between 2017 and 2018. Deaths due to accidental drowning and submersion decreased by 13.2 percent from 2017 (n=106) to 2018 (n=92). Additionally, Arizonans experienced a 12.3 percent increase in the number of accidental poisonings due to drugs and/or medicaments from 1,269 deaths in 2017 to 1,425 fatalities in 2018; **Table 2B-9**.

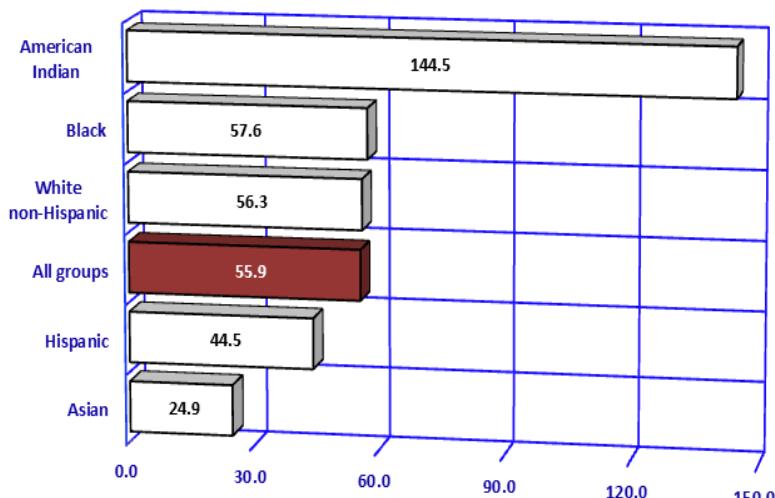

Note: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

Figure 2B-11
Age-adjusted Mortality Rates^a for Accidents (Unintentional Injuries) by Race/Ethnicity, Arizona, 2018

The American Indian death rate for unintentional injuries (144.5/100,000) was 5.8 times greater than the rate for Asians (24.9/100,000), the group with the lowest risk of unintentional injury death among racial/ethnic groups in the state (**Figure 2B-11, Table 2B-4**).

In 2018, Apache (134.1/100,000) and La Paz (123.6/100,000) counties had the two highest age-adjusted mortality rates for unintentional injuries (**Table 5E-11**).

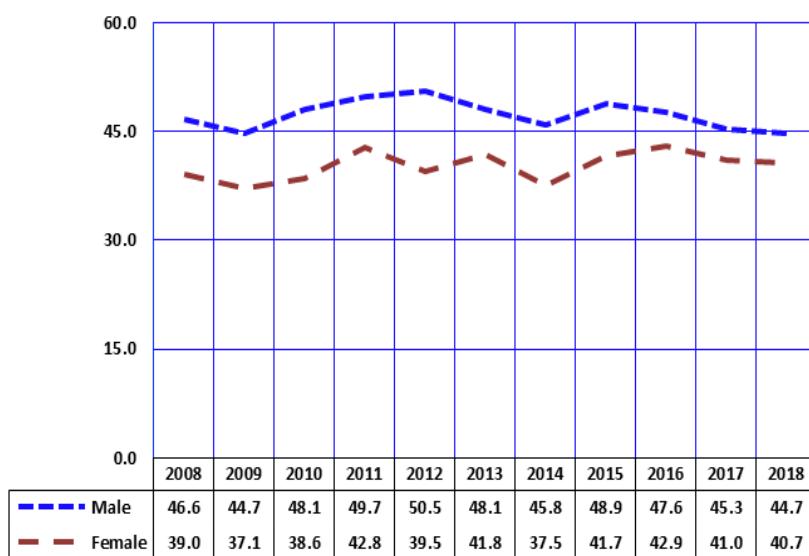

Note: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

2B. LEADING CAUSES OF DEATH

Chronic lower respiratory diseases

Figure 2B-12
Age-adjusted Mortality Rates^a for Chronic Lower Respiratory Diseases^b by Gender and Year, Arizona, 2008-2018

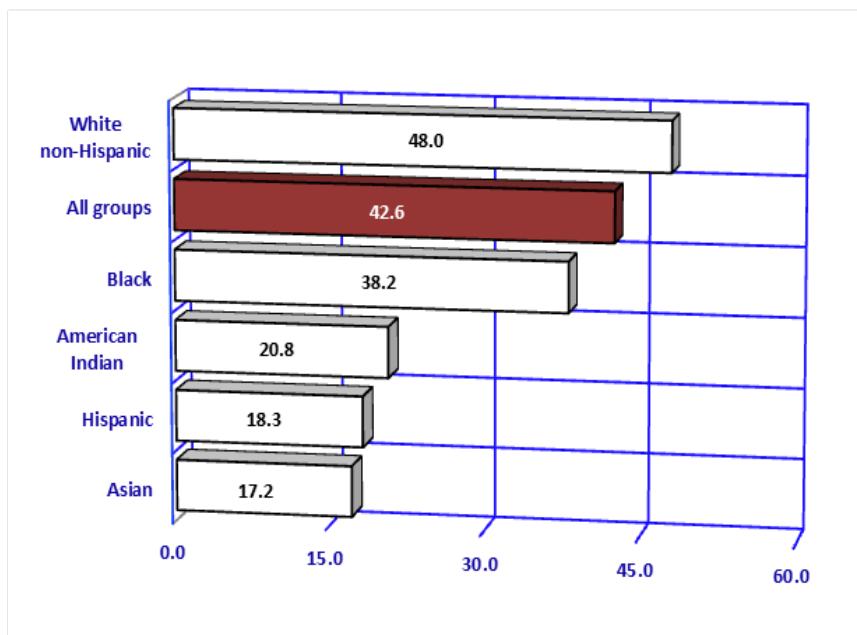

In 2018, chronic lower respiratory diseases (bronchitis, emphysema, asthma) were the 4th leading cause of death among Arizona residents (**Table 2B-1**). From 2017 to 2018, the mortality rate for chronic lower respiratory diseases decreased for both genders, but more so among males (1.3 percent) than females (0.7 percent; **Figure 2B-12, Table 2B-2**).

Urban females had the lowest mortality rate for chronic lower respiratory diseases (38.0/100,000) among the genders and by regional group (**Table 2B-5**). Rural males were the group with the highest mortality risk for chronic lower respiratory diseases (57.4/100,000), followed by rural females (52.7/100,000) and urban males (41.4 deaths per 100,000).

Notes: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard; ^bThis ICD-10 title corresponds to Chronic Obstructive Pulmonary Disease (ICD-9 title).

Figure 2B-13
Age-adjusted Mortality Rates^a for Chronic Lower Respiratory Diseases by Race/Ethnicity, Arizona, 2018

Mortality rates for emphysema, chronic bronchitis, asthma, and other lower respiratory disorders were substantially higher among White non-Hispanics (48.0 deaths per 100,000) than any other race/ethnic groups. Asians recorded the lowest rate at 17.2 deaths per 100,000 population (**Figure 2B-13, Table 2B-4**).

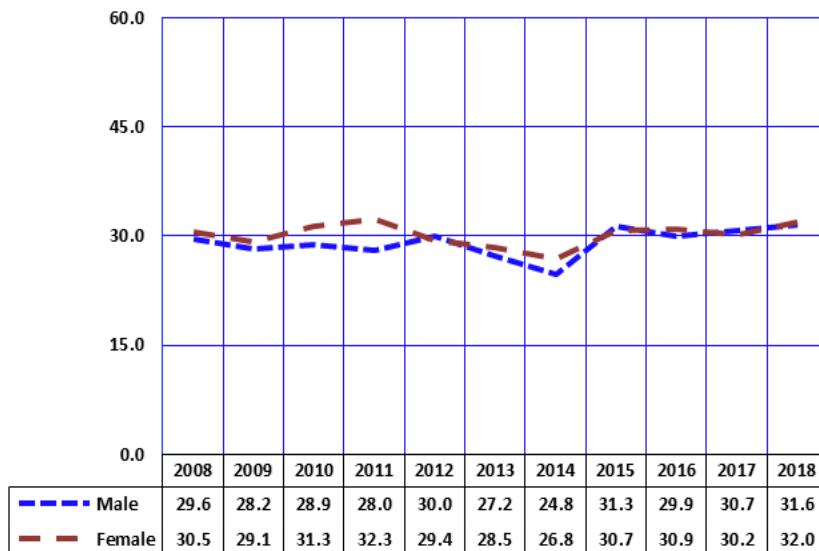

Note: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

2B. LEADING CAUSES OF DEATH Cerebrovascular diseases

Cerebrovascular disease and diseases of the heart are two of the leading causes of death that share many risk factors such as hypertension, smoking, obesity, and high levels of cholesterol. The age-adjusted mortality rate for cerebrovascular diseases increased by 4.6 percent from 30.7 deaths per 100,000 population in 2017 to 32.1/100,000 in 2018 (**Table 2B-3**).

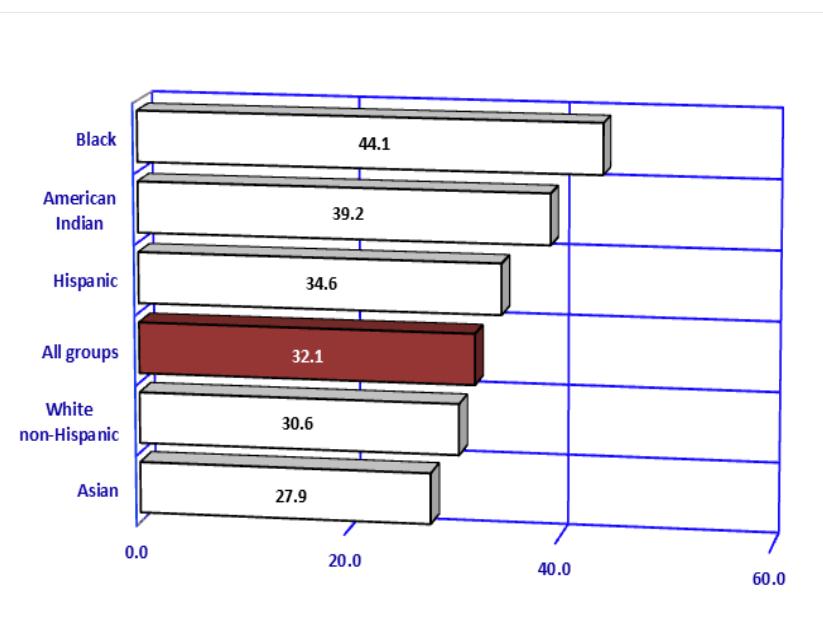

With some exceptions, the risk of dying from cerebrovascular diseases was generally higher among females than males for the period 2008-2018. In 2012, the age-adjusted mortality rate for stroke was greater among males than females, with male risk being slightly higher than female risk (**Figure 2B-14**). In 2018 as in 2015 and 2017, males experienced a higher risk of dying from cerebrovascular diseases than females. (**Figure 2B-14, Table 2B-2**).

Figure 2B-14
Age-adjusted Mortality Rates^a for Cerebrovascular Disease by Gender and Year, Arizona, 2008-2018

Note: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

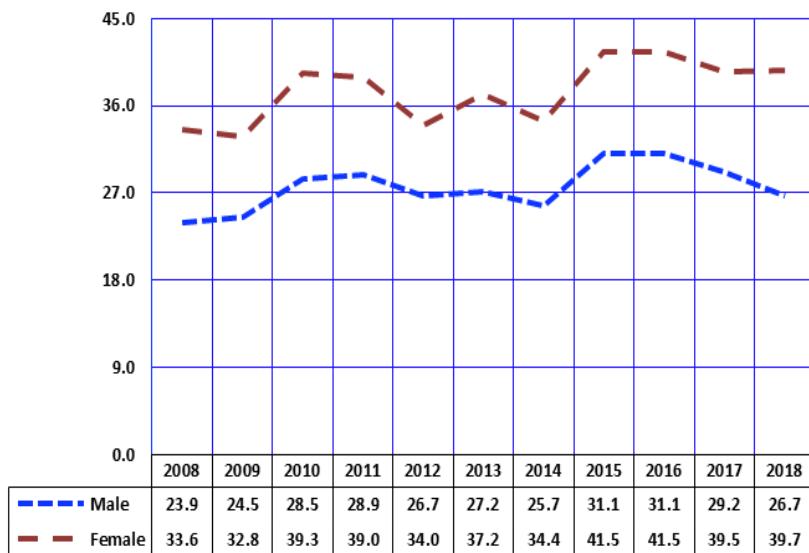

Figure 2B-15
Age-adjusted Mortality Rates^a for Cerebrovascular Disease by Race/Ethnicity, Arizona, 2018

Note: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

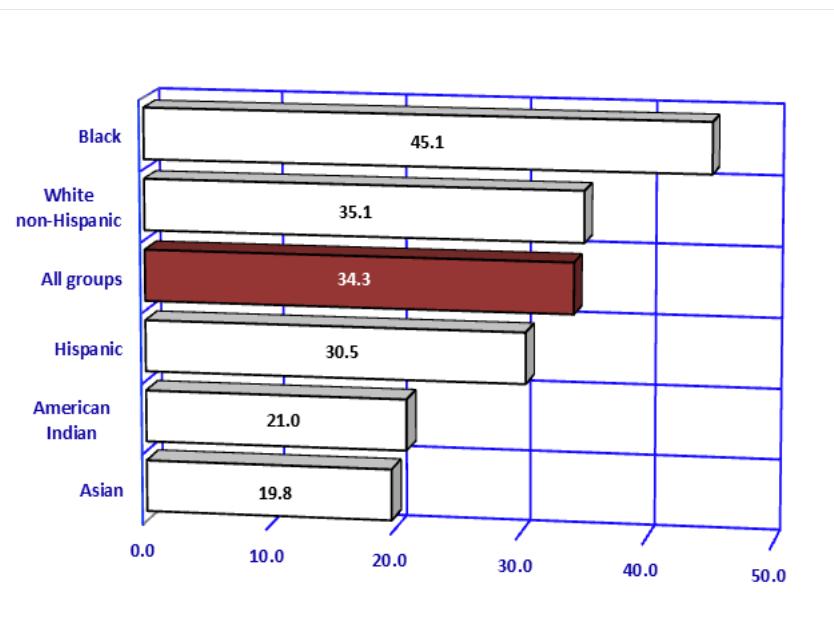

2B. LEADING CAUSES OF DEATH Alzheimer's disease

Figure 2B-16
Age-adjusted Mortality Rates^a for Alzheimer's Disease by Gender and Year, Arizona, 2008-2018

Note: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

Figure 2B-17
Age-adjusted Mortality Rates^a for Alzheimer's Disease by Race/Ethnicity, Arizona, 2018

Note: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

Based on the number of deaths in 2018, Alzheimer's disease was the 3rd leading cause of death for females and 8th leading cause for males (**Table 2B-4**).

From 2017 to 2018, the age-adjusted mortality rate for Alzheimer's disease decreased by 8.6 percent for males while it increased by 0.5 percent for females (**Figure 2B-16**).

The age-adjusted mortality rates for Alzheimer's disease in 2018 were higher among Black or African Americans (45.1/100,000), White non-Hispanics (35.1/100,000) than the other racial/ethnic groups. Rates lower than the state average were recorded among Asians (19.8/100,000), American Indians (21.0/100,000), and Hispanics (30.5/100,000; **Figure 2B-17, Table 2B-4**).

White non-Hispanic residents of Arizona disproportionately contributed to mortality from Alzheimer's disease. In 2018, White non-Hispanics accounted for 55.8 percent (**Table 10C-1**) of the state's population, but 84.6 percent of all deaths from Alzheimer's disease (2,548 out of 3,011; **Table 2B-4**).

In 2018, the overall median age at death from Alzheimer's disease was 87, specifically 85 years for males and 88 years for females (**Table 2D-3**).

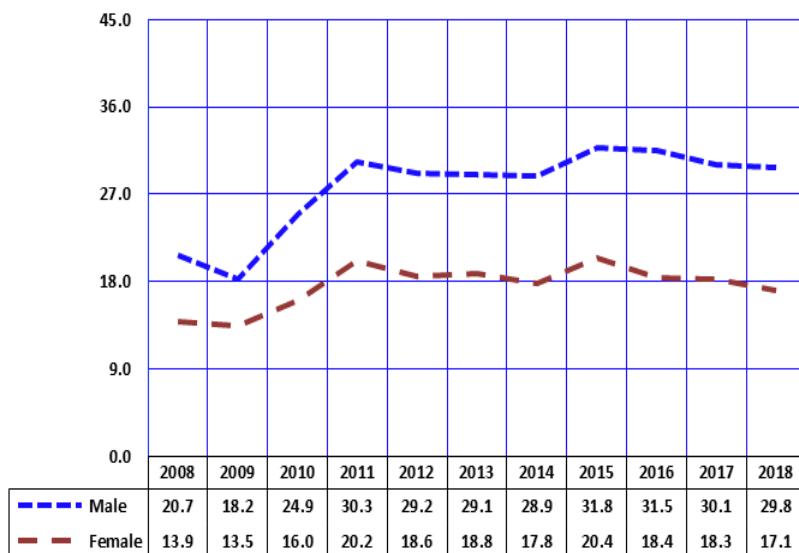

2B. LEADING CAUSES OF DEATH Diabetes

From 2008-2018, mortality rates for diabetes decreased among males (44.0 percent) while it declined among females (23.0 percent; **Figure 2B-18**).

In addition to 2,041 deaths that had diabetes assigned as the underlying cause in 2018, another 3,420 deaths had diabetes assigned as a contributing factor. The diabetes-related death rate of 61.7/100,000 (**Table 6A-6**) was 2.7 times greater than the rate for diabetes as an underlying cause (23.0/100,000; **Table 2B-2**).

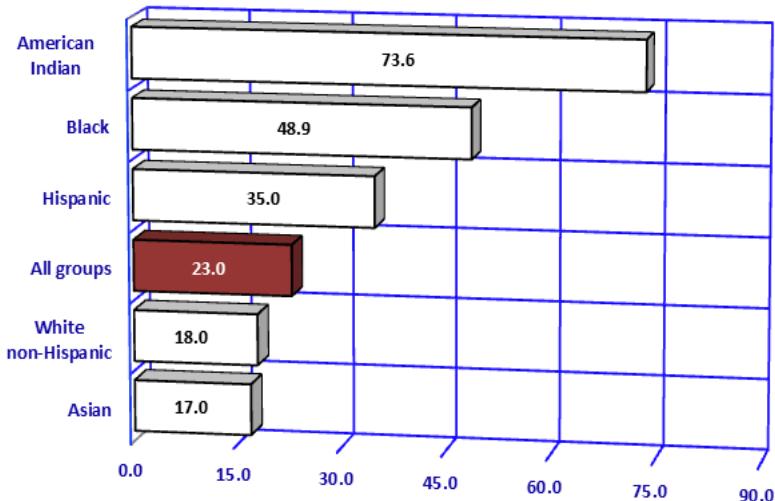

The diabetes-related death rate includes all mentions of diabetes on the death certificate as the underlying or other than underlying cause.

Figure 2B-18
**Age-adjusted Mortality Rates^a for Diabetes by Gender and Year,
Arizona, 2008-2018**

Note: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

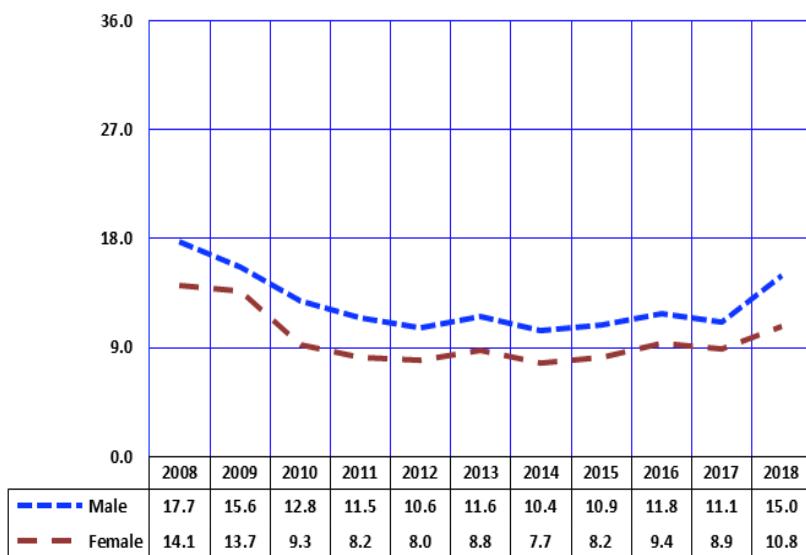

Figure 2B-19
**Age-adjusted Mortality Rates^a for Diabetes by Race/Ethnicity,
Arizona, 2018**

Note: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

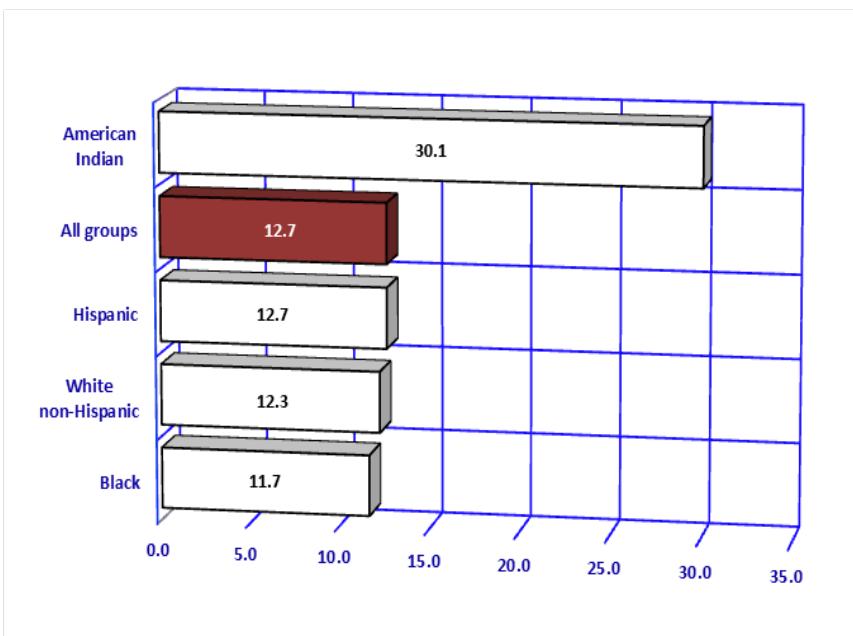

2B. LEADING CAUSES OF DEATH Influenza and pneumonia

Figure 2B-20
Age-adjusted Mortality Rates^a for Influenza and Pneumonia by Gender and Year, Arizona, 2008-2018

Note: ^a Number of deaths per 100,000 population age-adjusted 2000 U.S. standard.

Figure 2B-21
Age-adjusted Mortality Rates^a for Influenza and Pneumonia by Race/Ethnicity, Arizona, 2018

Note: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

The number of deaths from influenza and pneumonia increased by 3.5 percent from 1,075 in 2008 to 1,113 in 2018. (**Table 2B-1**). Among the 1,113 deaths, influenza was identified as the underlying cause for 213 of them, while pneumonia was listed as the underlying cause on 900 death certificates (**Table 2B-6**).

The mortality rate for influenza and pneumonia increased for females from 8.9 deaths in 2017 to 10.8 deaths per 100,000 in 2018 (**Figure 2B-20, Table 2B-2**). The mortality rate for influenza and pneumonia also increased for males from 11.1/100,000 in 2017 to 15.0 deaths per 100,000 in 2018.

In 2018, the age-adjusted mortality rate for Arizona males was 38.9 percent greater than that of Arizona females.

In 2018, American Indian residents of Arizona had the highest mortality rate for influenza and pneumonia (30.1 deaths per 100,000) among the racial/ethnic groups. The age-adjusted mortality of 11.7/100,000 among Blacks was the lowest rate in the state (**Figure 2B-21, Table 2B-4**).

County comparisons show that in 2018 influenza and pneumonia mortality rates were lower in Coconino, Pinal, Santa Cruz, Cochise and Maricopa Counties than in the remaining counties (**Table 5E-11**).

2B. LEADING CAUSES OF DEATH Suicide

Figure 2B-22
**Age-adjusted Mortality Rates^a for Suicide by Gender and Year,
Arizona, 2008-2018**

In 2018, based on age-adjusted mortality rates, suicide was the 6th leading cause of death among males. It ranked as the 11th cause of mortality for females. The overall age-adjusted suicide rate increased from 18.0 suicides per 100,000 in 2017 to 19.5 in 2018 (**Table 2B-4**).

From 2017 to 2018, suicide mortality increased by 12.1 percent among males, while it decreased 7.1 percent among females (**Figure 2B-22, Table 2B-4**). In 2018, suicide posed a 4 times greater mortality risk for males (31.5/100,000) than for females (7.8/100,000).

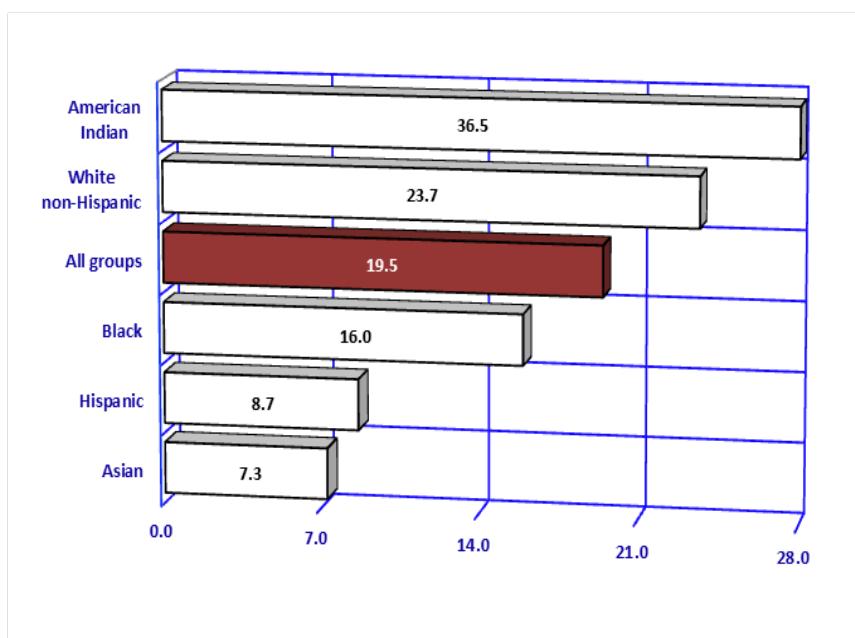

Note: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

Figure 2B-23
**Age-adjusted Mortality Rates^a for Suicide by Race/Ethnicity,
Arizona, 2018**

In 2018, American Indians had the highest age-adjusted suicide rate (36.5 suicides per 100,000) among racial/ethnic groups, followed by White non-Hispanics (23.7/100,000), while Asians recorded the lowest age-adjusted suicide rate (7.3/100,000; **Figure 2B-23, Table 2B-4**).

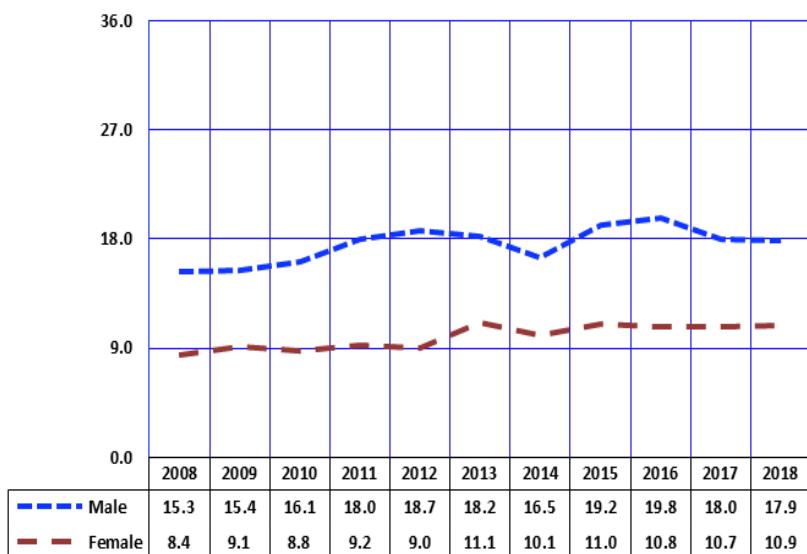

The 2018 age-adjusted mortality rates for suicide varied across the state, from a low rate of 9.7 suicides per 100,000 residents in Graham County to a high of 50.0 suicides per 100,000 residents in La Paz County (**Table 5E-11**).

Note: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

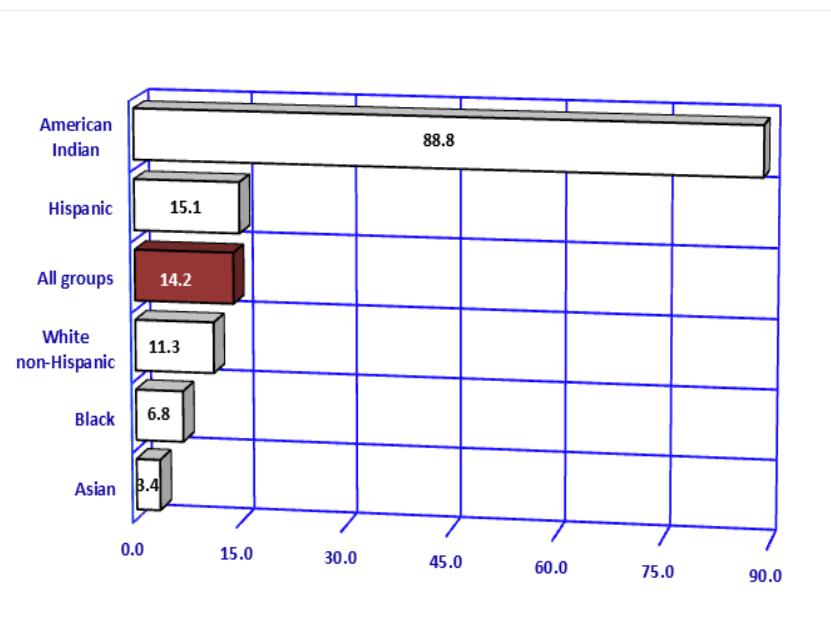

2B. LEADING CAUSES OF DEATH Chronic liver disease and cirrhosis

Figure 2B-24
Age-adjusted Mortality Rates^a for Chronic Liver Disease and Cirrhosis
by Gender and Year, Arizona, 2008-2018

Note: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

Figure 2B-25
Age-adjusted Mortality Rates^a for Chronic Liver Disease and Cirrhosis
by Race/Ethnicity, Arizona, 2018

Note: ^a Number of deaths per 100,000 population age-adjusted to the 2000 U.S. standard.

Chronic liver disease and cirrhosis was the 9th leading cause of death in Arizona in 2018 (**Figure 2B-1, Table 2B-1**). Among the 1,159 deaths due to chronic liver disease and cirrhosis, 712 (61.4 percent) were males (**Table 2B-4**).

Among females, the age-adjusted mortality rate for chronic liver disease and cirrhosis increased 1.9 percent from 2017 to 2018. Among males, the mortality rate decreased 0.6 percent from 18.0/100,000 in 2017 to 17.9/100,000 in 2018 (**Figure 2B-24, Table 2B-3**).

In 2018, La Paz, Navajo, Apache, and Gila counties had the highest mortality rates for chronic liver disease and cirrhosis (**Table 5E-11**).

In 2018, chronic liver disease and cirrhosis mortality rate was exceedingly high among American Indians (88.8 deaths per 100,000 population) than any racial/ethnic groups in the state (**Figure 2B-25, Table 2B-4**). Death rate for chronic liver disease and cirrhosis among Asians, Blacks and White non-Hispanics were all below the state average (14.2 deaths per 100,000 population).

Compared to the median age at death from all causes (76 years), those who died from chronic liver disease and cirrhosis were on average 16 years younger (60 years, **Table 2D-3**). In 2018, the median age at death of American Indians who died from chronic liver disease and cirrhosis was 49.5 years, which was 10.5 years younger than all the other race/ethnic groups (**Table 2D-3**).

TABLE 2B-1
NUMBER OF DEATHS FOR THE LEADING CAUSES OF MORTALITY BY YEAR, ARIZONA, 2008-2018

Rank in 2008	Rank in 2018	Cause of death	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
1	1	Diseases of heart	10,299	10,151	9,719	10,424	10,366	10,497	9,953	11,274	11,820	12,285	12,410

Notes: The cause-of-death titles are according to the Tenth Revision of the International Classification of Diseases (ICD-10). The causes of death for 2008-2018 are classified by ICD-10, replacing the Ninth Revision (ICD-9) used during 1979-1999. The group titles, such as cardiovascular diseases, infectious and parasitic diseases, or other cardiovascular diseases are not ranked to determine the leading causes of death. The ICD-10 code for the underlying cause of death was missing for as many as 140 in 2008.

Opioid-induced deaths	1,104	759	345	15.6	21.6	9.7
Alcohol-induced deaths	1,185	815	370	16.7	23.2	10.4

Notes: * Cell suppressed due to count less than 6; ** Cell suppressed due to rate/ratio/percent based on non-zero count less than 6; † Sum rounded to nearest tens unit due to addend less than 6; ^a Includes records with unknown gender; The list of Causes of Death was developed for the general analysis of ICD-10 mortality statistics and for ranking of leading causes of death. It is similar in structure and content and replaces the list of 72 Selected Causes of Death used for ICD-9 mortality statistics.

2C.

AGE-SPECIFIC MORTALITY

Six age-specific profiles of mortality are given on the following pages. The six developmental periods in the life span are:

- **Infants** less than one year of age
- **Children** 1 to 14 years old
- **Adolescents** or persons 15 to 19 years old
- **Young adults** or persons 20 to 44 years old
- **Middle-aged adults** or persons 45 to 64 years old
- **Elderly** or persons 65 years or older.

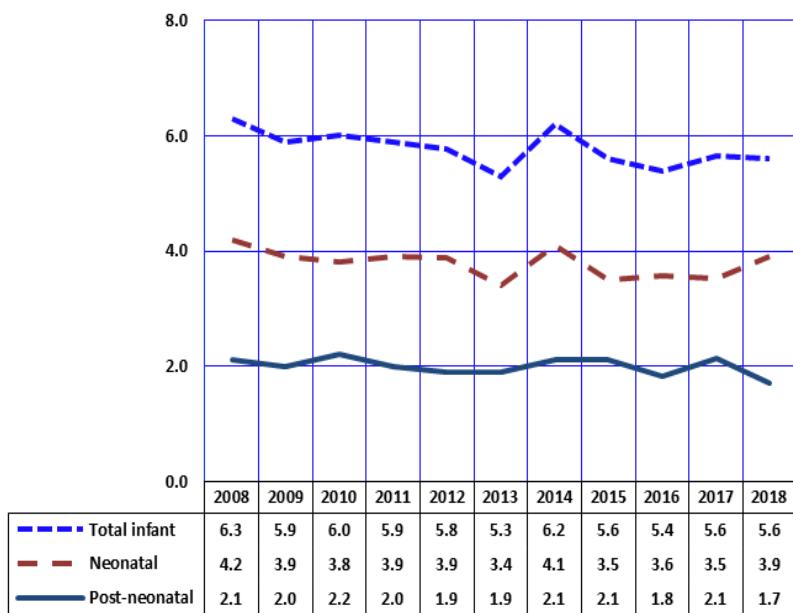

For each age group, cause-specific mortality is compared between urban (i.e., Maricopa, Pima, Pinal, and Yuma counties) and rural (all other counties) regions and between genders. Urban and rural regions also are compared in gender-specific total mortality.

A comparison of age-specific mortality for causes of death is provided in **Table 2C-27**. A comparison of age-specific mortality rates is presented in **Table 2C-28**.

2C.AGE-SPECIFIC MORTALITY

Infant mortality

Figure 2C-1
Infant Mortality Rates by Neonatal/Postneonatal Age and Year,
Arizona, 2008-2018

Notes: Neonatal deaths are those deaths affecting infants age 0-27 days; Post-neonatal deaths are deaths to infants aged 28 days-1 year.

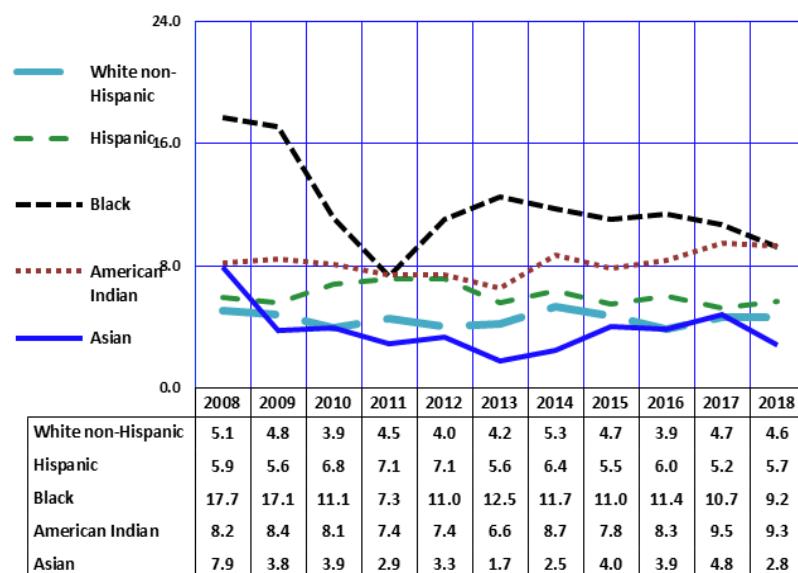

Infant mortality is defined as the number of deaths within the first year of life. The infant mortality rate is computed as the number of infant deaths in a calendar year per 1,000 live births recorded for the same period.

In 2018, 447 Arizona infants died before reaching their first birthday, 254 fewer than the latest peak of 701 infant deaths in 2007, and a decrease of 14 deaths in comparison to 2017 (**Table 2C-2**).

Even if the infant mortality rate remained the same as it was in 2007, 151 fewer infant deaths can be attributed to the absolute reduction in the number of births by 22,148 from 2007 to 2018 $((22,148 \times 6.8)/1,000) = 151$.

Based on the actual number of infant deaths and live births in 2018, the infant mortality remained unchanged from 2017 to 2018 (**Figure 2C-1**).

Figure 2C-2
Infant Mortality Rates^a by Race/Ethnicity and Year,
Arizona, 2008-2018

Note: ^a Number of infant deaths per 1,000 live births in specified group.

In 2018, 90.8 percent (406/447)* of all infant death records were successfully matched to their corresponding birth records.

The mortality risk for infants varies by race/ethnicity. Infants born to Asian or Pacific Islander mothers had the lowest mortality rates among the racial/ethnic groups in 2018 (**Figure 2C-2**, **Table 2C-2**).

In 2018, Black or African American and American Indian infants had the worst survival chances among the racial/ethnic groups (**Figure 2C-2**).

*Infant death records that were not linked to their corresponding birth certificates include unrecorded home births (i.e., no birth certificate was issued) and out-of-State births (i.e., the State issuing the certificate of birth did not send a copy to Arizona).

2C.AGE-SPECIFIC MORTALITY

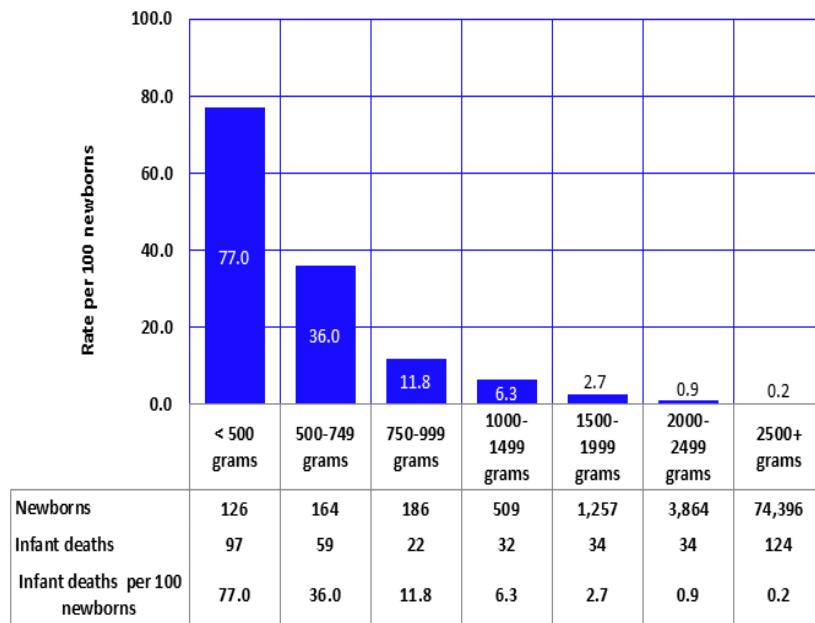

Infant mortality

Newborn weight at birth is one of the most important predictors of an infant's survival chances. In 2018, the mortality rate among babies weighing less than 500 grams at birth was 77.0 per 100 live births (**Figure 2C-3**).

The absolute number of low birthweight births remained lower in 2018 at 6,106 than at its peak in 2007 (7,285). The proportion of babies whose weight at birth was less than 1,000 grams increased slightly from 7.7 percent of all low birthweight births in 2017 to 7.8 percent in 2018 (**Table 1B-3**).

Together, infants weighing less than 1,500 grams accounted for 1.2 percent of births and 51.7 percent of all infant deaths with a matching birth record.

Figure 2C-3
Proportion of Infant Deaths by Birthweight, Arizona, 2018

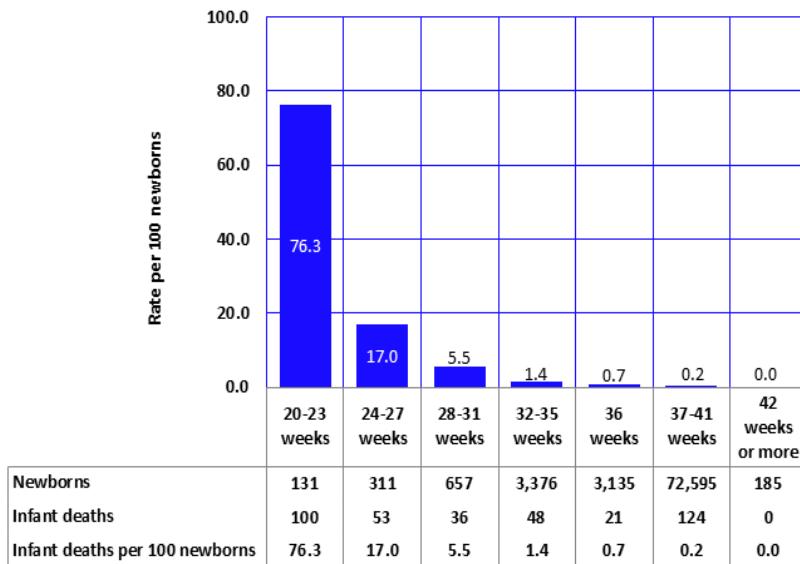

Note: 37 cases in the complete 2018 birth file had missing birthweight estimates.

As with low birthweight infants, preterm and very preterm babies contribute greatly to the total infant mortality rate because of their higher risk of mortality. For example, births occurring between 20-27 weeks of gestation accounted for only 0.5 percent of all births but 37.7 percent of infant deaths with a matching death record. Births at 20-23 weeks of gestation have a very high infant mortality rate of 76.3 per 100 live births (**Figure 2C-4**). Overall, preterm infants (those born at less than 37 weeks of gestation) accounted for 9.5 percent of all births (**Table 1B-2**) and 68.7 percent of all infant deaths (only those with matching death records).

Note: Counts of newborns listed in Figures 2C-3 and 2C-4 of the 2017 printed report have been adjusted in the online version of the report to reflect the actual numbers of resident births.

Figure 2C-4
Proportion of Infant Deaths by Gestational Age, Arizona, 2018

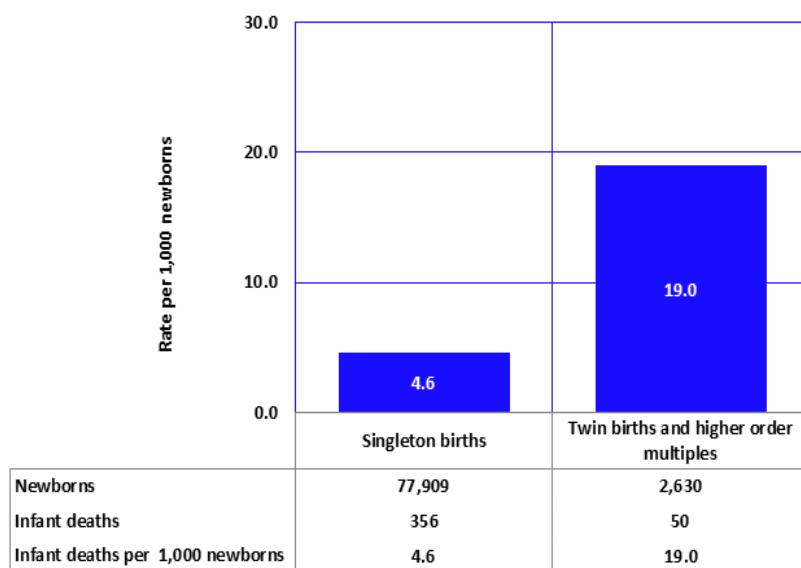

Note: 115 cases in the complete 2018 birth file had missing gestational age. Three of which were missing in the linked infant death file.

2C.AGE-SPECIFIC MORTALITY

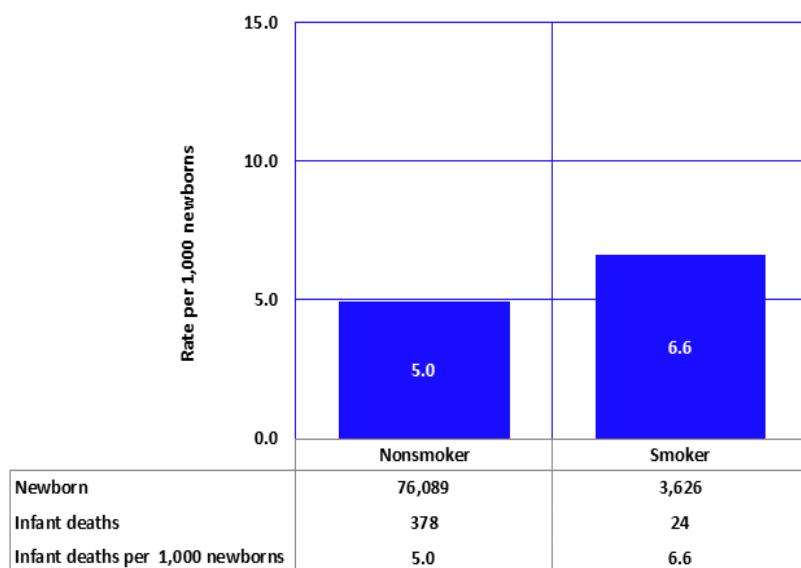

Infant mortality

Figure 2C-4.2
Infant Mortality Rates for Single and Multiple Births, Arizona, 2018

Note: 0 cases in the complete 2018 birth file were missing plurality.

Figure 2C-4.3
Infant Mortality Rates by Mother's Smoking Status during Pregnancy, Arizona, 2018

Note: 824 cases in the complete 2018 birth file were missing mothers' smoking status.

As already noted in Section 1B, infants born in multiple deliveries tend to be born at shorter gestations and smaller than those in singleton deliveries. In 2018, infants born in multiple deliveries were 12.4 times more likely (47.3 vs. 3.8 percent) to be born earlier than expected (at less than 37 completed weeks of gestation) and smaller (at less than 2,500 grams) than singleton births (**Figure 1B-10**).

The infant mortality rate for single births was 4.6/1,000 live births in 2018 (**Figure 2C-4.2**). The infant mortality rate for twin births or higher order multiples (19.0/1,000 live births) was 4.2 times higher than the infant mortality for singleton births.

Babies born in multiple deliveries accounted for 3.3 percent of births (**Table 1B-16**), but 12.3 percent of all infant deaths in Arizona in 2018 (only those with matching birth and death records).

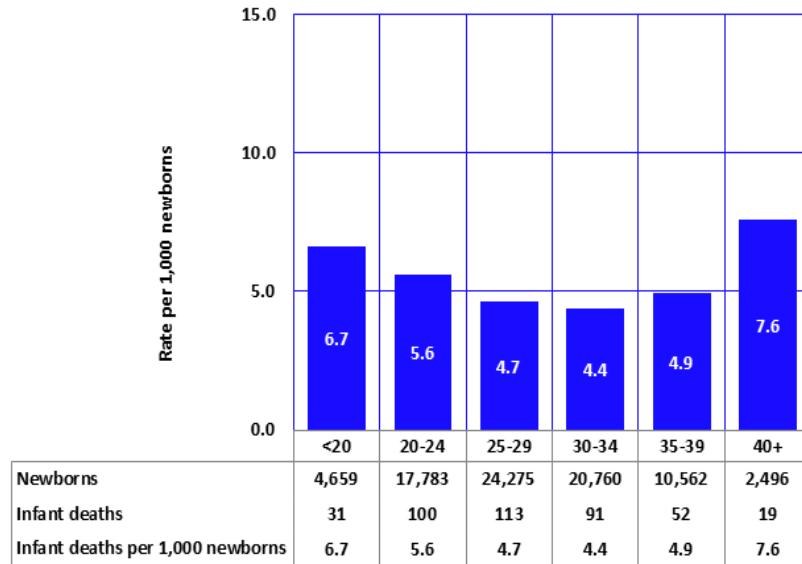

Smoking during pregnancy has been shown to increase the risk of preterm delivery, low birth weight and infant mortality. In 2018, among the 3,626 mothers who smoked during pregnancy, the risk of infant mortality was 1.3 times higher than among nonsmoker mothers (**Figure 2C-4.3**).

2C.AGE-SPECIFIC MORTALITY

Infant mortality

Figure 2C-4.4
Infant Mortality Rates by Mother's Age Group, Arizona, 2018

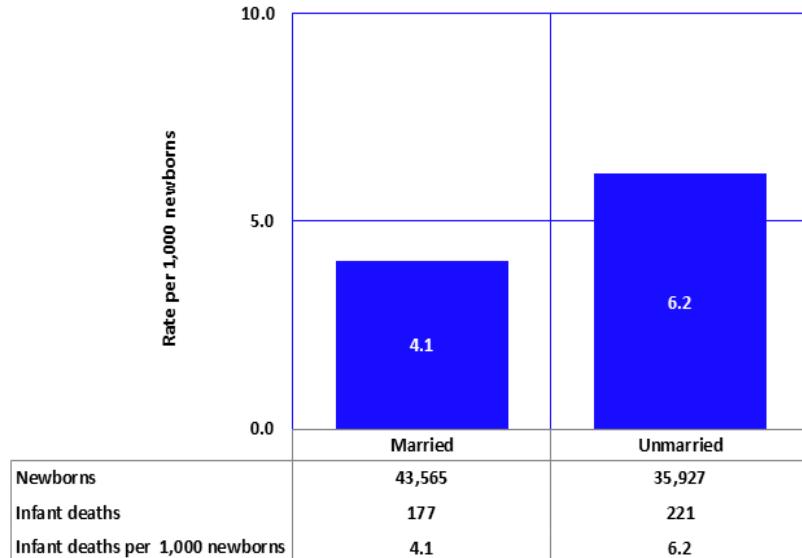

Infant mortality rates vary with maternal age. In 2018, infant mortality decreased with increasing maternal age through 30-34, but increased somewhat for infants born to women 35 years or older. Infants born to younger mothers (less than 20 years) and older mothers (40 years or over) had the highest infant mortality rates (**Figure 2C-4.4**).

Note: 4 cases in the complete 2018 birth file were missing mother's age.

Infants born to unmarried mothers accounted for the absolute majority of infant deaths in 2018 (221 infant deaths) compared to married mothers (177 infant deaths). In 2018, more children were born to married women (43,565) than their unmarried counterparts (35,927; **Table 1B-25**). Infants of unmarried mothers had an infant mortality rate of 6.2 deaths per 1,000 live births, 1.5 times higher than the rate for infants of married mothers (4.1 infant deaths per 1,000 live births; **Figure 2C-4.5**). The effect of marital status on infant mortality suggests that marital status is a proxy measure of factors traditionally related to infant mortality such as poverty conditions, access to health care and social support. Mother's marital status may signify the presence or absence of emotional, social, and financial resources.

Figure 2C-4.5
Infant Mortality Rates by Mother's Marital Status, Arizona, 2018

Note: 1,047 cases in the complete 2018 birth file were missing mother's marital status.

Notes: ** Cell suppressed due to rate/ratio/percent based on non-zero count less than 6;^a Number of infant deaths per 1,000 live births; leading causes of infant mortality are based on the list of 130 causes of infant death according to the Tenth Revision, International Classification of Diseases (ICD-10).

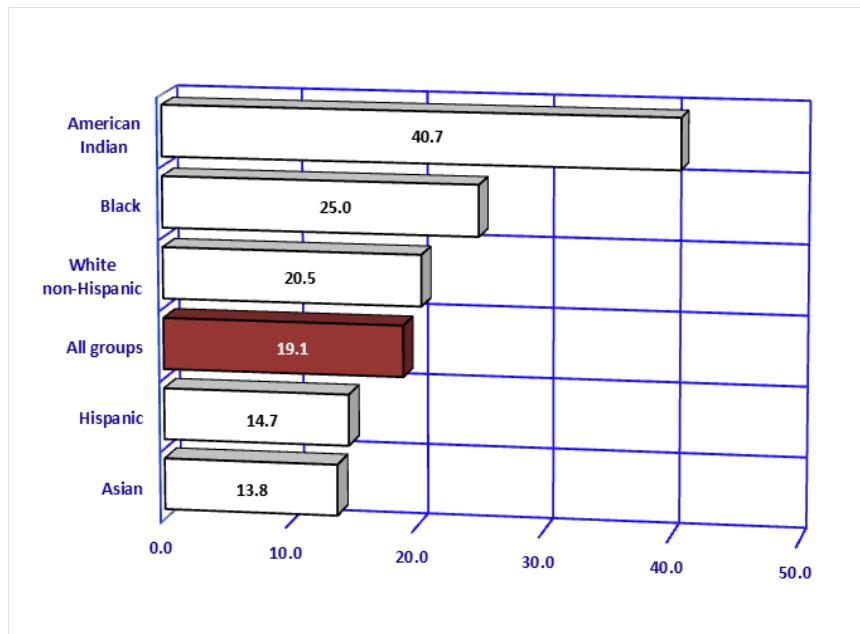

2C.AGE-SPECIFIC MORTALITY Childhood mortality (ages 1-14 years)

Figure 2C-5
**Mortality Rates^a by Gender and Year among Children 1-14 Years,
Arizona, 2008-2018**

Note: ^a Number of deaths per 100,000 persons, 1-14 years old in specified group.

Figure 2C-6
**Mortality Rates^a by Race/Ethnicity among Children 1-14 Years,
Arizona, 2018**

Note: ^a Number of deaths per 100,000 persons, 1-14 years old in specified group.

In 2018, a total of 244 deaths were recorded among 1,279,440 children aged 1-14 years residing in Arizona. The 2018 childhood mortality rate was 19.1 per 100,000, representing an increase from 18.2 the rate recorded in 2017 (**Table 2C-7**). Between 2017 and 2018 the mortality rate for male children witnessed an increase while the rate for female children decreased (**Figure 2C-5, Table 2C-7**).

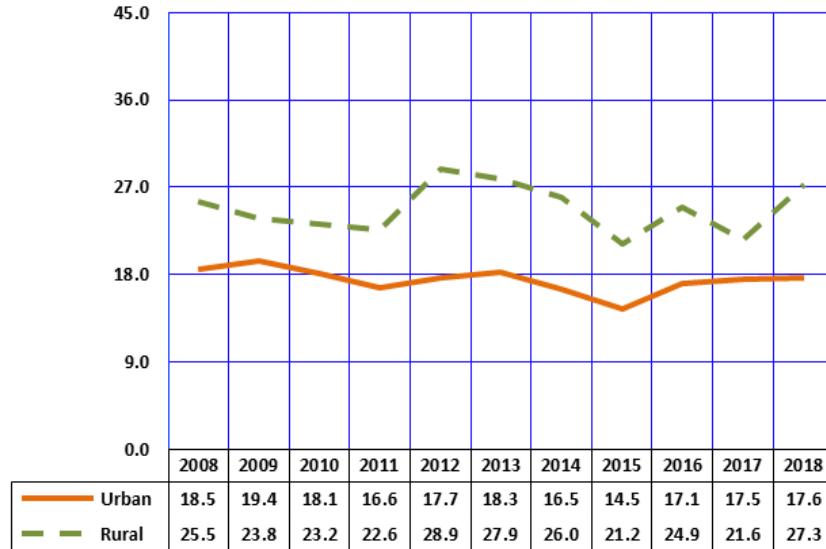

The five causes with the greatest mortality rates in childhood from 2008-2018 were *accidents* (unintentional injuries), *malignant neoplasms*, *congenital malformations*, *homicide*, and *suicide* (**Table 2C-7**).

American Indian children had the highest total mortality rate (40.7 deaths per 100,000) in 2018, followed by Black or African American children (25.0/100,000; **Figure 2C-6**). The mortality rates of Asian and Hispanic or Latino children were lower than the average rate for all groups.

It is important to note that the mortality rate of Asians is based on a very low death count (**Table 2C-10**) thus not statistically reliable. In 2018, there were fewer than 6 children who died from congenital anomalies or by means of suicide among this age group (**Table 2C-10**).

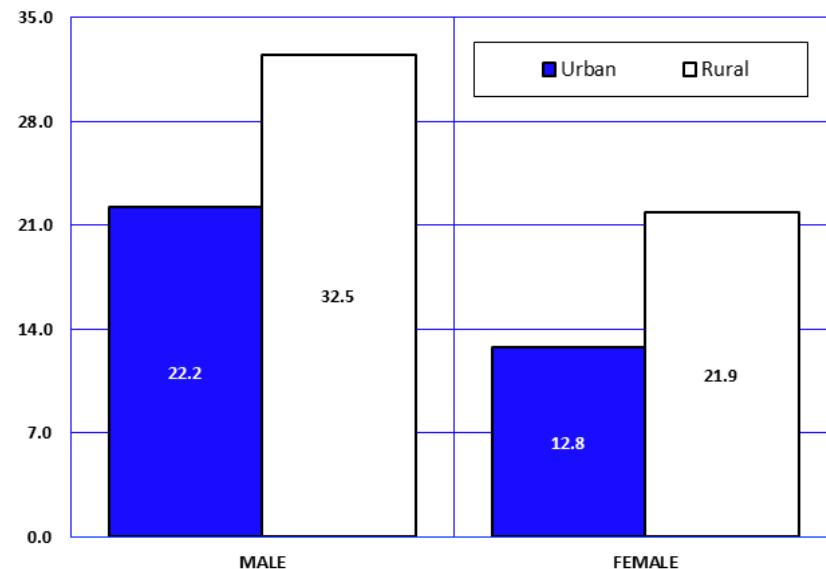

2C.AGE-SPECIFIC MORTALITY
Childhood mortality (ages 1-14 years)

Figure 2C-7
**Mortality Rates^a by Urban/Rural Area^b and Year among Children 1-14 Years,
Arizona, 2008-2018**

Notes: ^a Number of deaths per 100,000 persons, 1-14 years old in specified group; ^b Urban counties are Maricopa, Pima, Pinal, and Yuma Counties. Rural counties are those remaining.

Figure 2C-8
**Mortality Rates^a by Gender in Urban/Rural^b Areas among Children 1-14 Years,
Arizona, 2018**

Notes: ^a Number of deaths per 100,000 persons, 1-14 years old in specified group; ^b Urban counties include Maricopa, Pima, Pinal, and Yuma Counties. Rural counties are those remaining.

2C.AGE-SPECIFIC MORTALITY Adolescent mortality (ages 15-19 years)

Figure 2C-9
**Mortality Rates^a by Gender and Year among Adolescents 15-19 Years,
Arizona, 2008-2018**

Notes: ^a Number of deaths per 100,000 persons, 15 - 19 years old in specified group.

Figure 2C-10
**Mortality Rates^a by Race/Ethnicity among Adolescents 15-19 Years,
Arizona, 2018**

Note: ^a Number of deaths per 100,000 persons, 15 - 19 years old in specified group.

Adolescence refers to individuals between the ages of 15 and 19, an important developmental period marking the transition from childhood to adulthood. In 2018, an estimated 471,388 adolescents resided in Arizona, comprising 6.7 percent of the State's population (**Table 10A-1**). The lives of 295 resident adolescents prematurely ended in 2018, resulting in a total mortality rate of 62.6 deaths per 100,000 adolescents. This mortality rate was 4.7 percent lower than the 2008 rate (**Table 2C-11**).

The likelihood of dying was approximately two-fold greater for adolescent boys than for adolescent girls in 2018 (**Figure 2C-9, Table 2C-11**).

The five causes with the greatest number of deaths over the 2008-2018 period were *unintentional injuries in accidents, suicide, homicide, malignant neoplasms, and diseases of heart* (**Table 2C-14**).

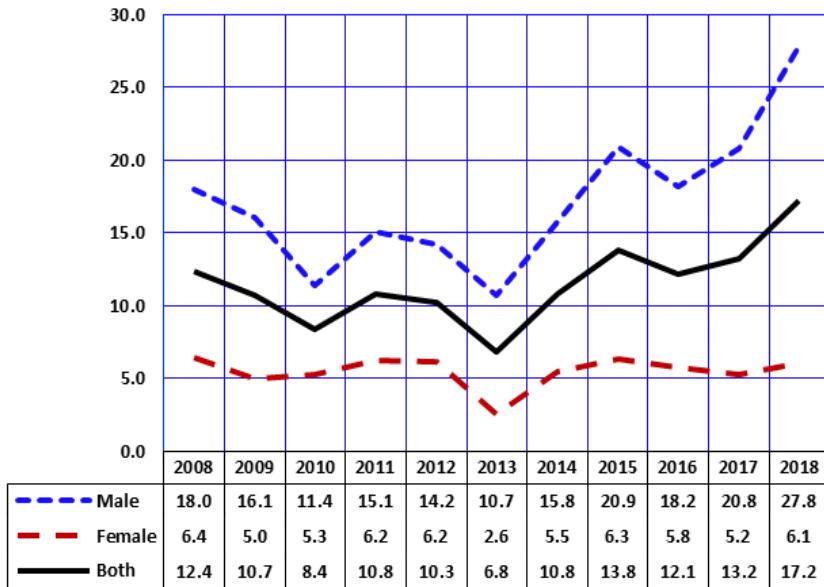

In 2018, adolescents who were Asian, Hispanic, or White had greater survival chances than the state average for all adolescents. American Indian had the lowest survival chances of all racial/ethnic groups (**Figure 2C-10**). If the 2018 mortality risk of Asian adolescents (i.e., their mortality rate) was applied to all adolescents, only 182 would have died: 113 less than the 295 who actually did.

2C.AGE-SPECIFIC MORTALITY Adolescent mortality (ages 15-19 years)

Figure 2C-11
**Suicide Rates^a by Gender and Year among Adolescents 15-19 Years,
Arizona, 2008-2018**

In 2018, eighty one suicide deaths were recorded among Arizonans age 15-19 years, an increase from 62 in 2017 (**Table 2C-14**). In 2018, as in prior years, male adolescents accounted for the absolute majority (82.7 percent) of completed suicides.

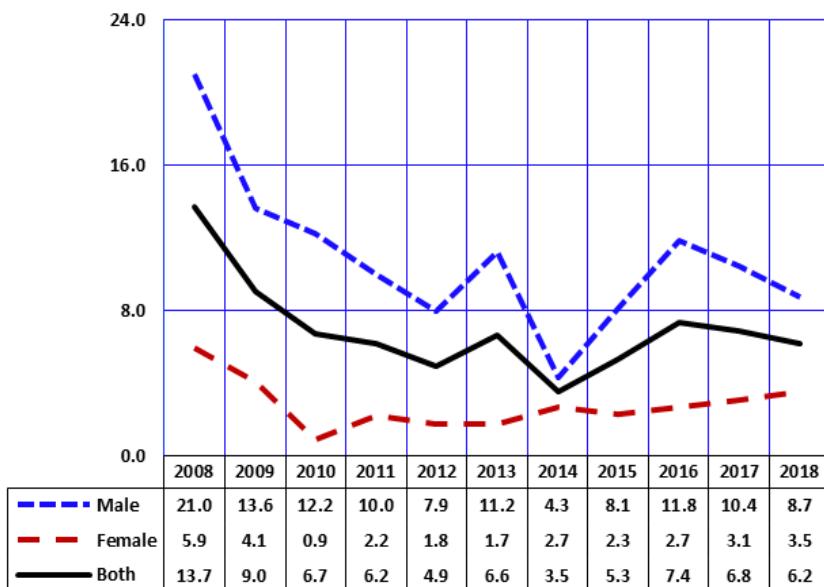

The suicide rate in 2013 was the lowest recorded since at least 1990 (**Figure 2C-11, Table 2C-11**). Compared to 2008, the adolescent male suicide rate (27.8) was 54.4 percent higher in 2018 while the adolescent female suicide rate (6.1) was 4.7 percent lower during the same year. The male to female ratio in suicide mortality rates increased from 2.8:1 in 2008 to 4.6:1 in 2018. In other words, male adolescents were almost 5 times more likely to kill themselves in 2018 than female adolescents, compared to 2.8 times more likely in 2008.

Note: ^a Number of suicide deaths per 100,000 persons, 15 - 19 years old in specified group.

Figure 2C-12
**Homicide Rates^a by Gender and Year among Adolescents 15-19 Years,
Arizona, 2008-2018**

From 2008 to 2018, homicide rates decreased for both adolescent males and females (**Figure 2C-12, Table 2C-11**). From 2008 to 2012, the homicide rate decreased by 62.4 percent for adolescent males, and by 69.5 percent for adolescent females. A shift occurred in 2013, as the adolescent homicide mortality rate increased for males while still declining for females. From 2017 to 2018, the overall rate of adolescent homicide deaths decreased by 8.8 percent. Looking at gender specific homicide mortality, there was a decrease of 16.3 percent for males but an increase of 12.9 percent for females.

Note: ^a Number of homicide deaths per 100,000 persons, 15 - 19 years old in specified group.

In 2018, there were no cases of mortality for Symptoms, signs, abnormal findings.

2C.AGE-SPECIFIC MORTALITY Young adult mortality (ages 20-44 years)

Figure 2C-13
**Mortality Rates^a by Gender and Year among Young Adults 20-44 Years,
Arizona, 2008-2018**

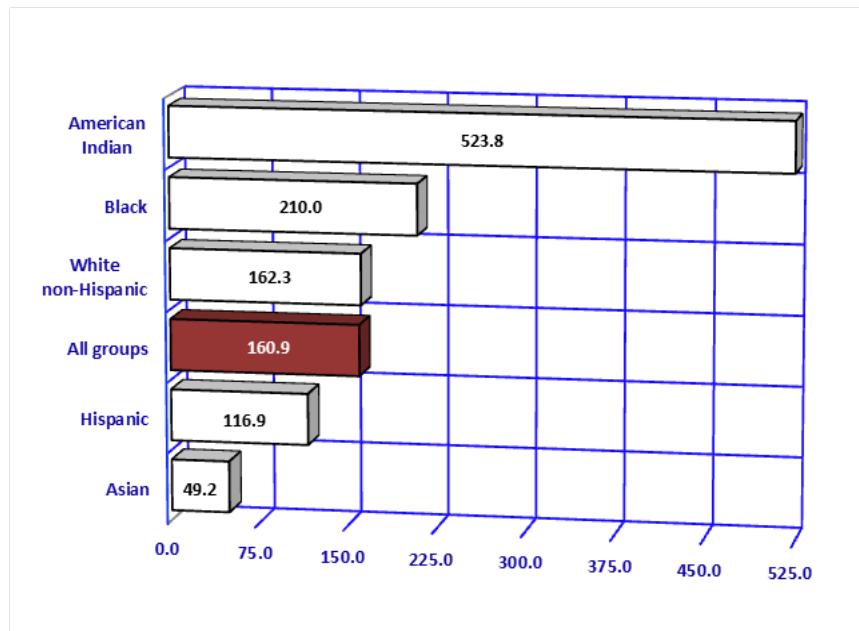

In 2018, 32.7 percent of Arizona residents were between 20 and 44 years of age. Among the six developmental periods examined in the life span, young adulthood, with an estimated 2.3 million individuals, easily represented the largest segment of the population. However, only 6.3 percent of all deaths occurred during young adulthood.

The number of deaths among young adults rose 31.7 percent from 2008 to 2018. Compared to 2017, the young adult mortality rate increased 4.6 percent for males and decreased 0.2 percent for females (**Figure 2C-13, Table 2C-15**).

Note: ^a Number of deaths per 100,000 persons, 20-44 years old in specified group.

Figure 2C-14
**Mortality Rates^a by Race/Ethnicity among Young Adults 20-44 Years,
Arizona, 2018**

The 2018 mortality among young adults shows racial/ethnic disparities. American Indians aged 20-44 years had the highest mortality rates while Asians of the same age group recorded the lowest mortality rate across all groups.

American Indian young adults had a mortality rate 2.5 times greater than Black or African American adults, the racial/ethnic group with the second highest young adult mortality rate. The American Indian young adult mortality rate was 3.3 times higher than the state average for young adults and 10.6 times greater than Asian young adults.

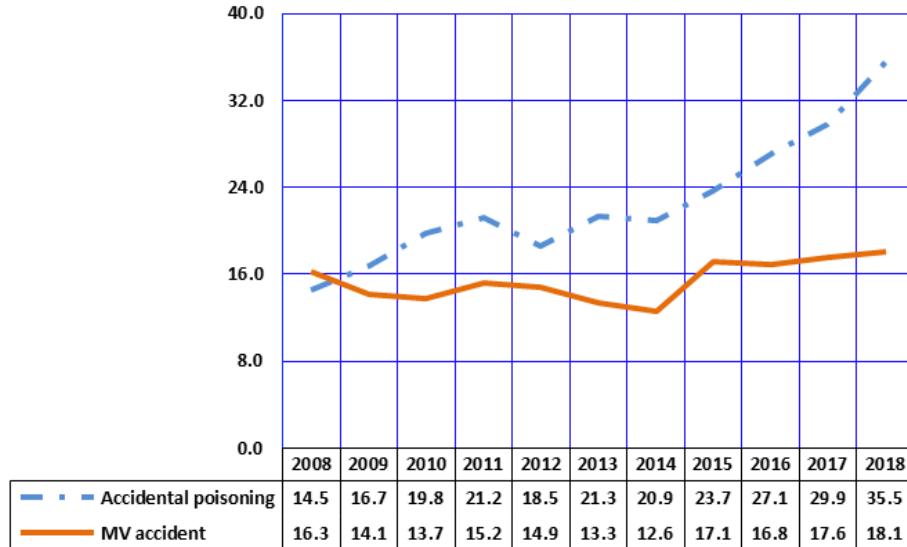

Note: ^a Number of deaths per 100,000 persons, 20-44 years old in specified group.

2C.AGE-SPECIFIC MORTALITY

Young adult mortality (ages 20-44 years)

In 2018, 823 deaths of young adults were attributed to accidental poisoning (**Table 2C-18**), an increase of 21.2 percent from 2017. The mortality rate for accidental poisoning among young adults (35.5 /100,000) exceeded the mortality rate for motor vehicle-related injuries. In the past decade, excess of mortality due to accidental poisoning has been consistently recorded in each year since 2009 (**Figure 2C-15**). Among the young adults 20-44 years, 778 accidental poisoning deaths were due to drug overdose (ICD-10 X40-44) and 38 deaths were due to alcohol poisoning (ICD-10 X45).

Figure 2C-15
Mortality Rates^a for Motor Vehicle-Related Injuries and Accidental Poisoning by Year among Young Adults 20-44 Years, Arizona, 2008-2018

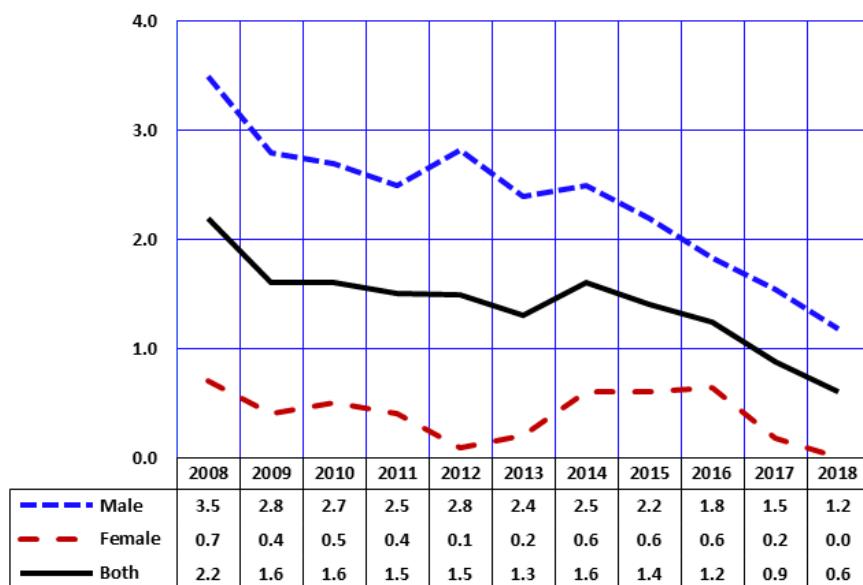

Note: ^a Number of motor vehicle and accidental poisoning deaths per 100,000 persons, 20-44 years old in specified group.

Figure 2C-16
Mortality Rates^a for HIV Disease by Gender and Year among Young Adults 20-44 Years, Arizona, 2008-2018

In 2018, of the 79 deaths from HIV disease about 17.7 percent occurred among Arizonans 20-44 years old (**Table 2C-27**), a decrease from 22.7 percent in 2017. Males accounted for all of the young adult deaths from HIV disease in 2018 (**Table 2C-18**).

The mortality rate for HIV disease among young male adults decreased 65.7 percent from 3.5/100,000 adults 20-44 years in 2008 to 1.2/100,000 in 2018.

Note: ^a Number of HIV deaths per 100,000 persons, 20-44 years old in specified group.

2C.AGE-SPECIFIC MORTALITY

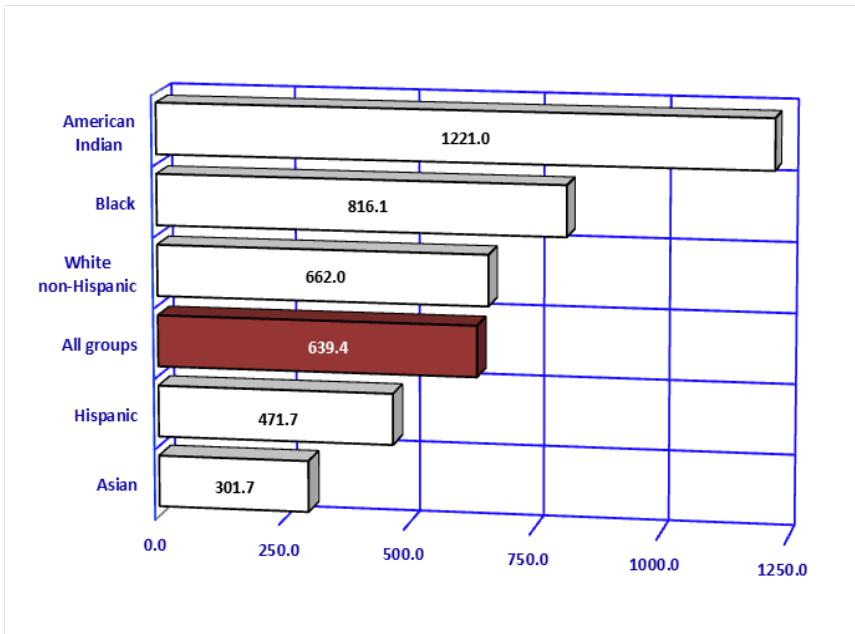

Middle-aged adult mortality (ages 45-64 years)

Figure 2C-17
**Mortality Rates^a by Gender and Year among Middle-Aged Adults 45-64 Years,
Arizona, 2008-2018**

Note: ^a Number of deaths per 100,000 persons, 45-64 years old in specified group.

Figure 2C-18
**Mortality Rates^a by Race/Ethnicity among Middle-Aged Adults 45-64 Years,
Arizona, 2018**

Note: ^a Number of deaths per 100,000 persons, 45-64 years old in specified group.

In 2018, the 1,707,764 middle-aged adult residents aged 45 to 64 experienced 10,920 deaths, or an average of 30 deaths, per day. The total number of deaths among 45-64 year old Arizona residents in 2018 (10,920) was the highest number recorded since 1980, and is likely the greatest number of deaths among this age group in Arizona's history (**Table 2C-19**).

The 2018 total mortality rate among middle-age females was 3.6 percent higher, and among middle-aged males 11.1 percent higher than their respective rates in 2008 (**Figure 2C-17, Table 2C-19**). In 2018, the mortality rate for males age 45 - 64 was almost twofold the female mortality of the same age group.

The five causes with the greatest number of deaths in 2008-2018 were *malignant neoplasms, diseases of heart, accidents, chronic liver disease and cirrhosis, and chronic lower respiratory diseases* (**Table 2C-19**).

American Indian, Black or African American, and White non-Hispanic middle-aged adults had the three highest mortality rates (1221.0/100,000, 816.1/100,000, and 662.0/100,000, respectively) among the racial/ethnic groups.

If the 2018 total mortality rate for Asian middle-aged adults applied to all Arizona residents 45-64 years old, 5,153 middle-aged adults would have died rather than the 10,920 who actually did.

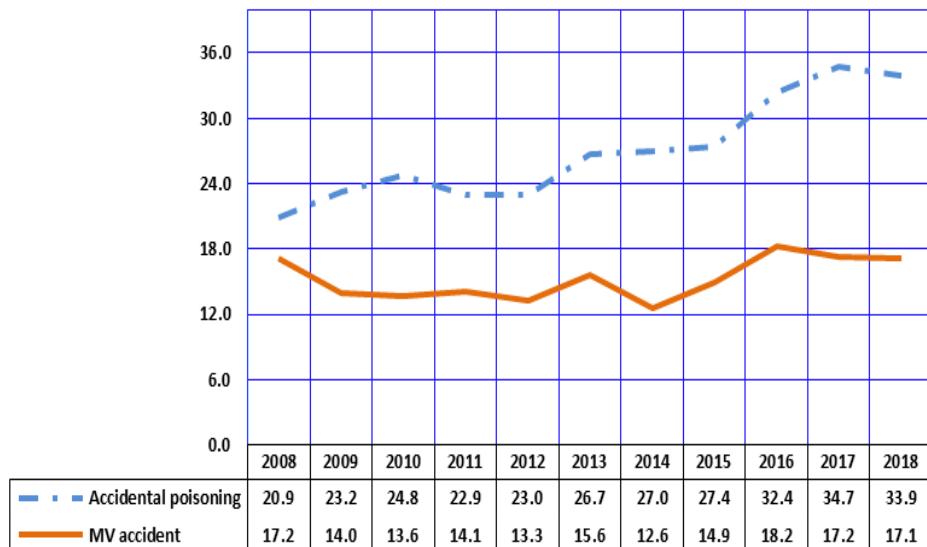

2C.AGE-SPECIFIC MORTALITY

Middle-aged adult mortality (ages 45-64 years)

The 2018 mortality rate due to accidental poisoning was 33.9 per 100,000 adults aged 45-64 years, a decrease of 2.3 percent from 2017. In 2018, about 579 deaths were attributed to accidental poisoning (**Table 2C-22**). Of the accidental poisoning deaths in this age group, 522 were drug overdoses (ICD-10 X40-X44) and 53 were alcohol poisoning (ICD-10 X45).

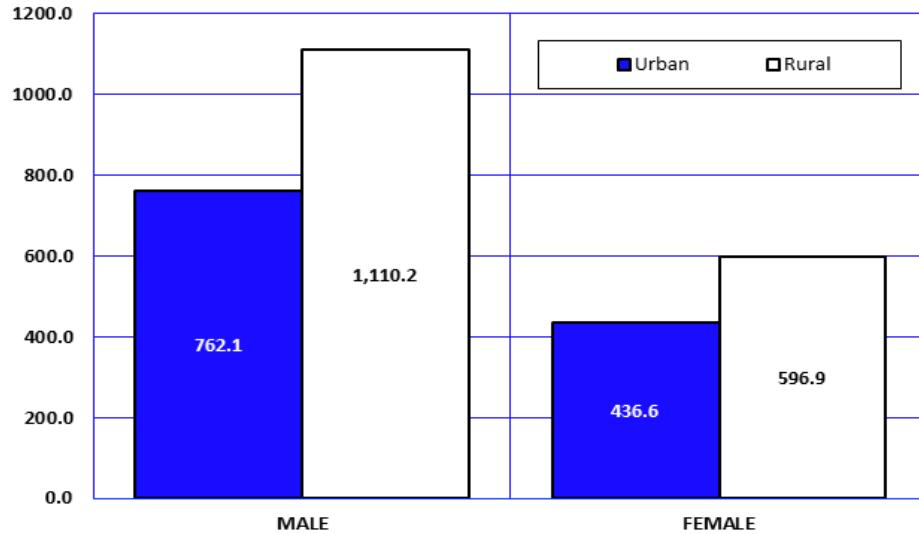

Beginning in 2007, the mortality rate for accidental poisoning exceeded the mortality rate for motor vehicle-related injuries among the middle-aged (**Figure 2C-19**). In 2018, accidental poisoning mortality rate of 33.9 per 100,000 middle-aged adults was 2.0 times higher than the mortality rate of 17.1 per 100,000 for motor vehicle accidents. White non-Hispanics accounted for about 66.7 percent of all accidental poisoning deaths (**Table 2C-22**).

Figure 2C-19
Mortality Rates^a for Accidental Poisoning and Motor Vehicle-related Injuries by Year among Middle-Aged Adults 45-64 Years, Arizona, 2008-2018

Note: ^a Number of motor vehicle and accidental poisoning deaths per 100,000 persons, 45-64 years old in specified group.

Figure 2C-20
Mortality Rates by Gender in Urban^a and Rural Areas among Middle-Aged Adults 45-64 Years, Arizona, 2018

In 2018, as in the past, rural middle-aged males had the worse survival chances than the remaining of the sub-groups (**Figure 2C-20, Table 2C-21**). The mortality rate for rural middle-aged males in 2018 was 1.5 times greater than for urban males, 1.9 fold greater than rural females, and 2.5 fold greater than urban females.

Note: ^a Urban counties include Maricopa, Pima, Pinal, and Yuma counties.

TABLE 2C-21

**Mortality Rates^a by Race/Ethnicity among Elderly 65 Years and Older,
Arizona, 2018**

Note: ^a Number of deaths per 100,000 persons, 65+ years old in specified group.

In 2018, an estimated 1,214,261 residents age 65 years and older resided in the state (**Table 10A-1**). No other age group has as great of a disproportionate gender distribution as the elderly. As a result of the higher total mortality rates for males at earlier ages, more elderly women than men were alive in 2018.

The 2018 elderly mortality rate of 3588.4 per 100,000 was 5.4 percent lower than the 2008 rate of 3,791.3 (**Table 2C-23**).

The 2018 total mortality rate among elderly females was 7.1 percent lower than their rate in 2008. The mortality rate among elderly males decreased 4.0 percent during the same period (**Figure 2C-21, Table 2C-23**).

In 2018 the mortality rate for Arizona's American Indian elderly residents was 1.7 times that of the Asian elderly population. The mortality rate of 2,244.9 /100,000 among elderly Asians was the lowest rate among the racial/ethnic groups (**Figure 2C-22**). Hispanic or Latino elderly had the second lowest mortality rate in 2018 at 3,112.0/100,000.

2C.AGE-SPECIFIC MORTALITY

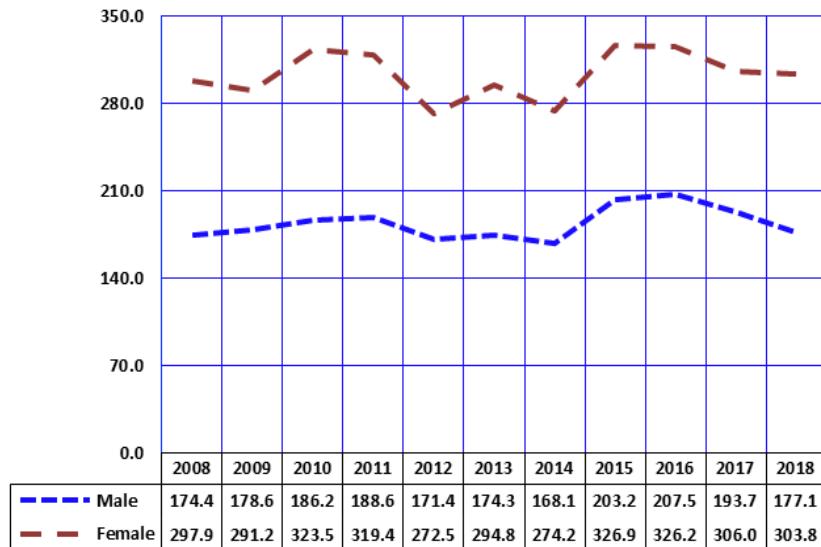

Elderly mortality (ages 65 years and older)

Tables, 2C-23 and 2C-24 provide mortality rates for the five causes with the greatest number of deaths over the 2008–2018 period.

In 2018, Alzheimer's disease (2,979 deaths; **Table 2C-26**) accounted for 6.8 percent of elderly mortality. From 2017 to 2018, mortality due to Alzheimer's disease decreased for both genders (**Figure 2C-23**).

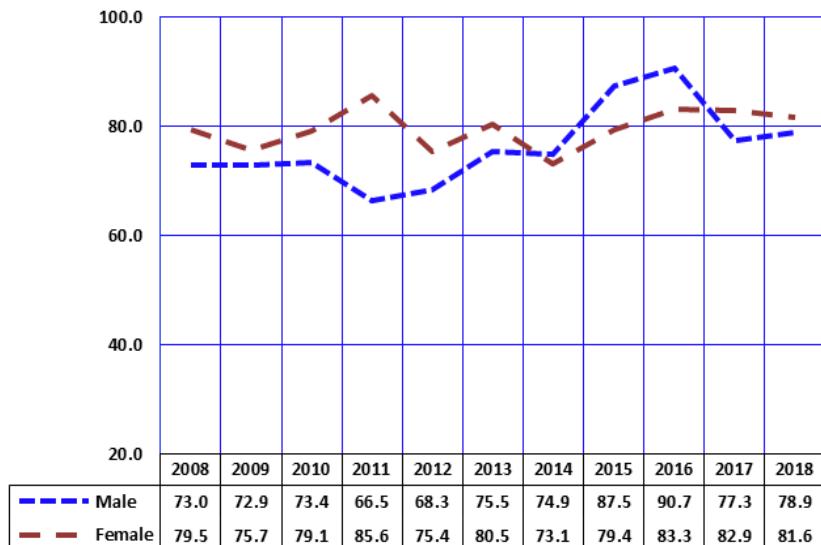

There were 1,987 deaths from Alzheimer's disease among elderly females in 2018, approximately twice the number of deaths from this cause among males (992; **Table 2C-26**). White non-Hispanic elderly accounted for 84.8 percent of the 2018 deaths from Alzheimer's disease (based on data in **Table 2C-26**).

Figure 2C-23
Trends in Mortality Rates for Alzheimer's Disease^a by Gender and Year among Elderly 65 Years and Older, Arizona, 2008-2018

Note: ^a Number of deaths due to Alzheimer's disease per 100,000 persons, 65+ years old in specified group.

Figure 2C-24
Trends in Mortality Rates for Falls and Fall-related Injuries^a by Gender and Year among Elderly 65 Years and Older, Arizona, 2008-2018

Note: ^a Number of deaths due to falls and fall-related injuries per 100,000 persons, 65+ years old in specified group.

2D.

PATTERNS OF PREMATURE MORTALITY

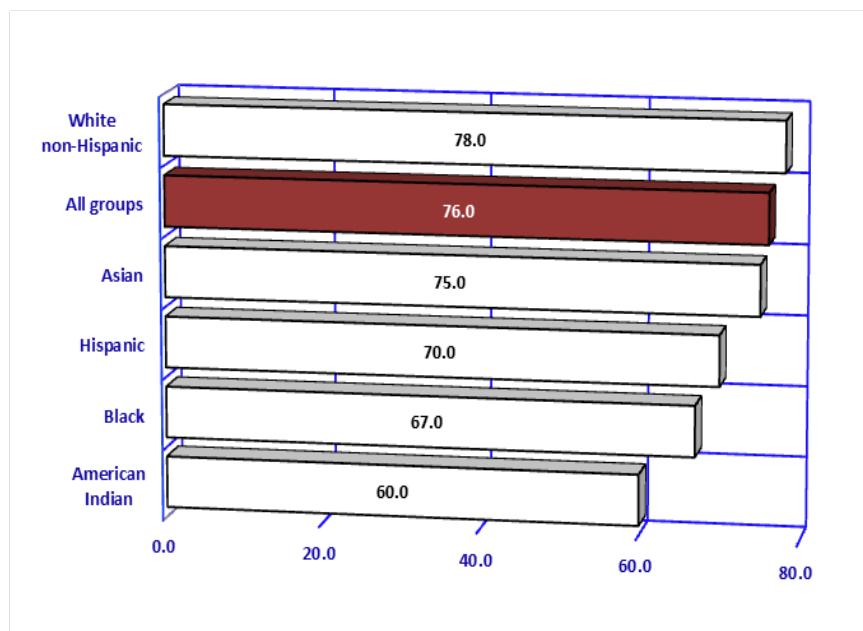

In 2018, the race /ethnic minority groups represented greater percentage of people younger than 25 years (43.3%) than White non-Hispanics (24.6%). In contrast, people aged 65 years and older accounted for 24.7 percent of White non-Hispanics, but only 7.6 percent of all ethnic minority groups combined (percentages based on race-and-age-specific population denominators in **Table 10C-1**).

Arizona's population distribution by age and race/ethnicity is related to patterns of mortality among these subgroups. In 2018, of all deaths among the elderly (65 years and older), 82.0 percent were White non-Hispanics, 10.9 percent were Hispanic or Latino, with the three remaining racial/ethnic groups comprising only 6.4 percent of all deaths in this age group (**Table 2C-26**). Looking at younger ages, Native American children comprised only 5.4 percent of Arizona's population age 1–14, but accounted for 11.5 percent of all childhood deaths. Native American adolescents represented only 5.0 percent of all adolescents, but accounted for 11.2 percent of all adolescent deaths. Finally, Native American young adults (ages 20–44) represented 4.7 percent of all young adults but comprised 15.5 percent of all young adult deaths. In summary, Arizona's racial/ethnic minority groups tend to experience mortality earlier in life than Arizona's White non-Hispanics.

Beginning with the 2005 edition of the report, information about the arithmetic mean age at death was supplemented with information about the median age, or the age in the center of the distribution when sorted by age (see **Table 2D-1**). The median age is higher than the arithmetic mean age in negatively skewed distributions.

2D. PATTERNS OF PREMATURE MORTALITY

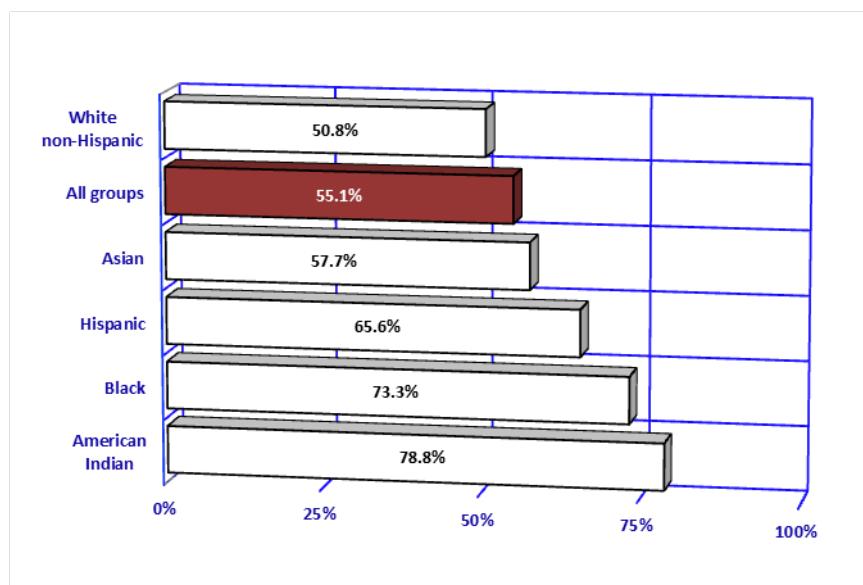

Figure 2D-1
Median Age at Death by Race/Ethnicity, Arizona, 2018

The median age at death remained at 76 years from 2014 to 2018 (**Table 2D-1**). In other words, one of every two Arizonans who died in 2018 was older than 76 years of age. Among Arizona females, 50 percent were 80 years old when they died in 2018. Among males, the median age at death was 73 years in 2018. **Table 2D-1** shows both the median age at death by race/ethnicity and gender from 2008-2018.

In 2018, compared to White non-Hispanics, on average Asians were 3 years younger at time of death, Hispanics were 8 years younger, Blacks were 11 years younger, and American Indian residents of Arizona were 18 years younger (based on the median age at death).

Figure 2D-2
Percent of Deaths before Expected^a Years of Life Reached by Race/Ethnicity, Arizona, 2018

In 2018, the percent of deaths before expected years of life reached (a premature death ratio) was 55.1 percent, -a level that remained unchanged from the prior year (**Figure 2D-2**).

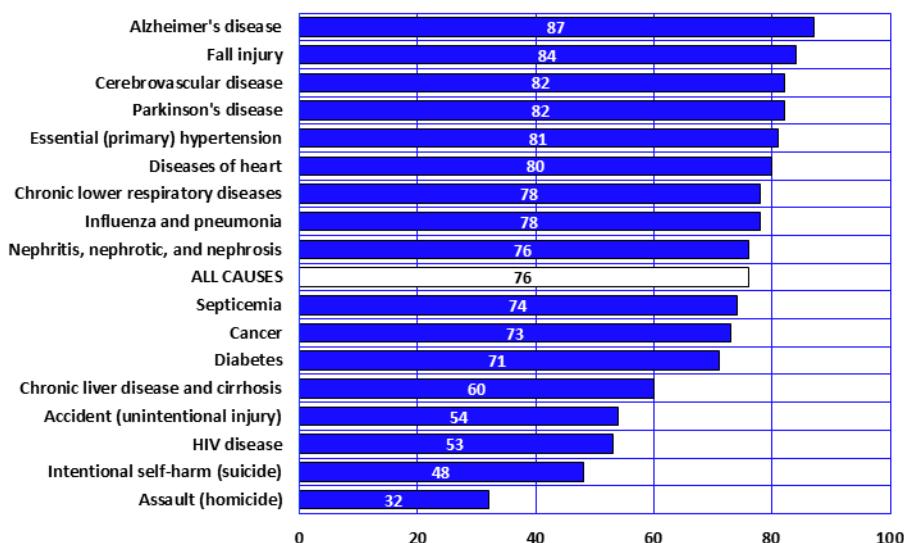

As expected, based on the findings for average and median age at death, White non-Hispanics were the only group with about 50 percent of all deaths (50.8 percent) occurring before the expected years of life were reached (**Figure 2D-2**). On average, 68.7 percent of the deaths among racial/ethnic minority groups occurred prematurely.

Among American Indians, nearly eight out of ten deaths (78.8 percent) were premature (**Table 2D-2**).

Note: ^a Expected years of life at birth for all U.S. residents (78.8 years).

2D. PATTERNS OF PREMATURE MORTALITY

Figure 2D-3
**Median Age at Death for Selected Leading Causes of Death,
 Arizona, 2018**

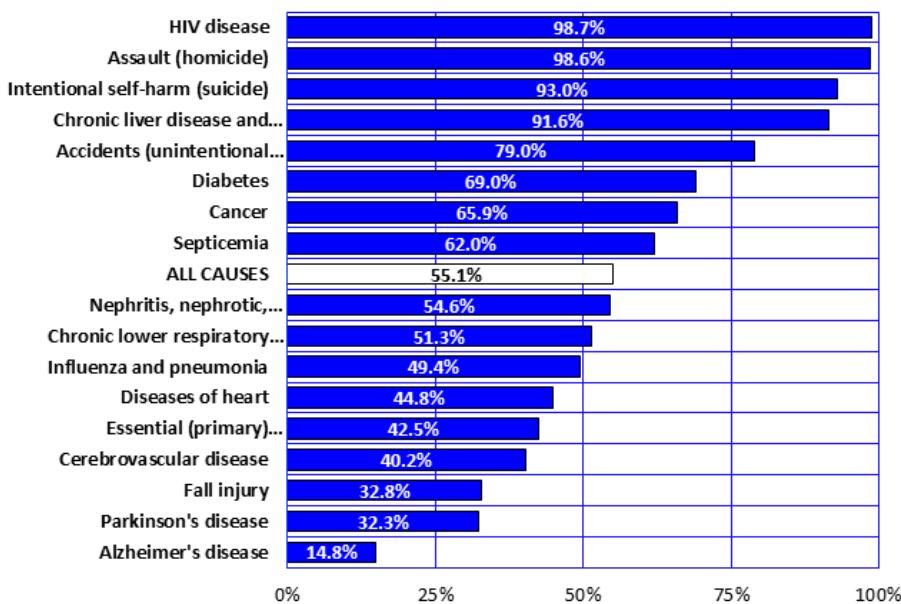

In 2018, *Alzheimer's disease* had the highest median age of death at 87 years (**Figure 2D-3**), exceeding by 11 years the median age at death for all causes (**Figure 2D-3, Table 2D-3**).

Among the leading causes of death, *homicide* had the lowest median age at death of 32 years.

From 2010-2015, *cancer* replaced *diseases of the heart* as the leading cause of death (based on the number of deaths). This epidemiologic transition in mortality risks is likely to have long lasting implications for the life expectancy of Arizonans, because the median age at death from *cancer* (73 years) is substantially lower than the median age at death from *diseases of the heart* (80 years).

Figure 2D-4
**Percent of Deaths before Expected Years of Life^a Reached for
 Selected Leading Causes of Death, Arizona, 2018**

Only 14.8 percent of deaths from *Alzheimer's disease* occurred before the age of 78.8 years, i.e., before the expected years of life were reached. In contrast, almost all deaths from *HIV disease* were premature (98.7 percent; **Figure 2D-4, Table 2D-4**). The median age at death from *HIV disease* was 53 years in 2018, showing a decrease from 54 years recorded in 2017 (**Figure 2D-3, Table 2D-3**).

A minority of deaths from *diseases of heart* were premature (44.8 percent). In contrast 65.9 percent of deaths from *cancer* occurred before the expected years of life were reached.

Note: ^a Expected years of life at birth for all U.S. residents (78.8 years).
