

CHAPTER 3

REPORTABLE DISEASES, ARIZONA, 2009-2019

- 3A. NON-SEXUALLY TRANSMITTED DISEASES**
- 3B. SEXUALLY TRANSMITTED DISEASES**
- 3C. HUMAN IMMUNODEFICIENCY VIRUS (HIV)
DISEASE AND ACQUIRED IMMUNODEFICIENCY
SYNDROME (AIDS)**

3A.

NON-SEXUALLY TRANSMITTED DISEASES

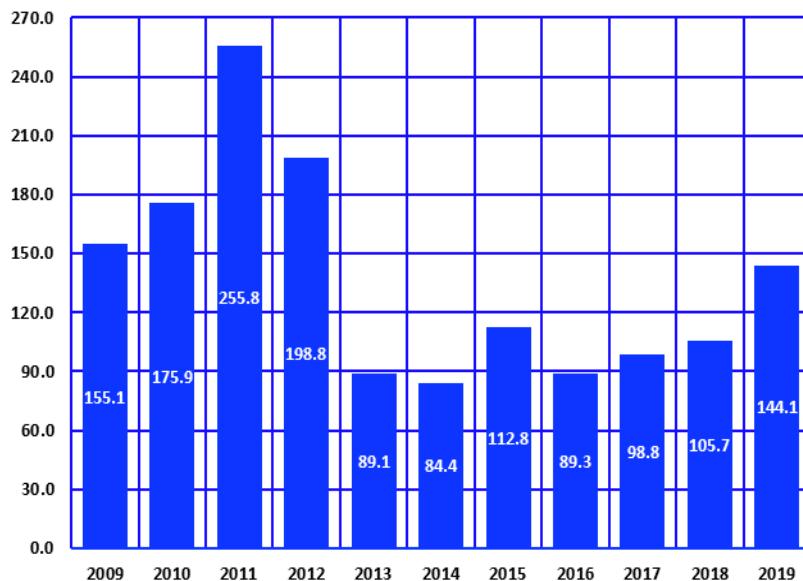

The infectious diseases designated as notifiable vary slightly by state. A notifiable disease is one for which regular, frequent, and timely information regarding individual cases is considered necessary for the prevention and control of the disease. All states generally report the internationally quarantinable diseases (i.e., cholera or plague) in compliance with the World Health Organization's International Health Regulations.

Data on morbidity, levels of disease, and disability in the Arizona population are obtained for certain infectious diseases that must be reported by law. The Bureau of Epidemiology and Disease Control Services conducts surveillance and monitoring of these reportable diseases and it provided data for the respective sections of this chapter and sections 5F, 6A, and 6B.

This section provides some illustrative findings from the tabulated data. It is not intended to be an exhaustive analysis of the incidence of infectious diseases in the State. There is more information available online on the website of the Office of Infectious Disease Services at: <http://azdhs.gov/phs/oids/index.htm>.

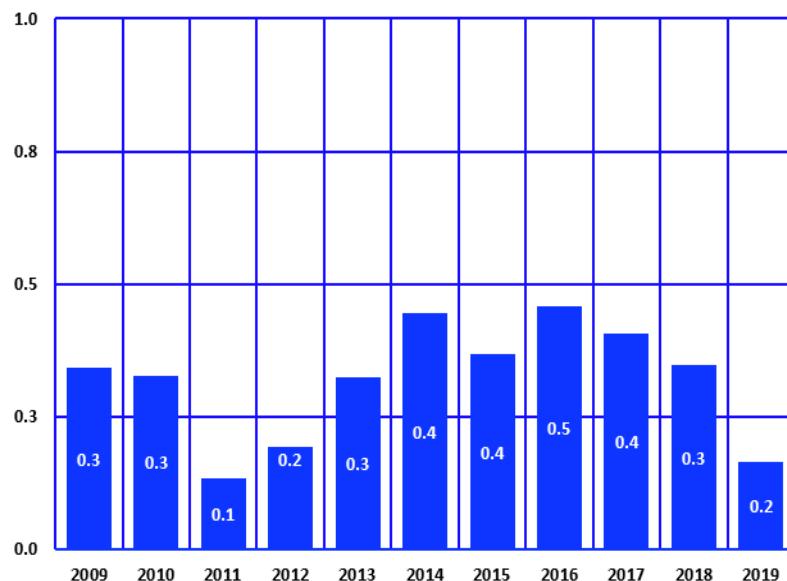

3A. NON-SEXUALLY TRANSMITTED DISEASES

Figure 3A-1
Trends in the Incidence Rates^a of Valley Fever (Coccidioidomycosis) by Year, Arizona, 2009-2019

Note: ^a Number of cases per 100,000 population.

Figure 3A-2
Trends in Case Fatality Rates^a for Valley Fever (Coccidioidomycosis) by Year, Arizona, 2009-2019

Note: ^a Number of deaths per 100 reported cases.

Coccidioidomycosis or *Valley Fever* is a fungal infection caused by inhalation of airborne spores that are present in the soil of southwestern United States, California, and parts of Central and South America. Most infections are asymptomatic or self-limited in patients with healthy immune systems. In rare instances, severe lung disease or disseminated infection can develop in patients.

Valley Fever imposed the greatest burden on morbidity among all non-sexually transmitted, notifiable diseases in Arizona in 2019. The reported incidence of *Valley Fever* increased 38.5 percent from 2018 ($n=7,478$) to 2019 ($n=10,358$). The 2019 incidence rate of 144.1/100,000 (**Figure 3A-1, Table 5F-2**) was 36.3 percent greater than the incidence rate of 105.7/100,000 in 2018, but was 43.7 percent lower than the unprecedented incidence rate of 255.8/100,000 in 2011.

Seventeen of the 10,358 Arizonans who had *Valley Fever* in 2019 died from it (**Table 3A-2**) for a case fatality rate of 0.2 deaths per 100 cases (**Figure 3A-2**). The 2019 case mortality rate for Coccidioidomycosis was 52.0 percent lower than in 2009.

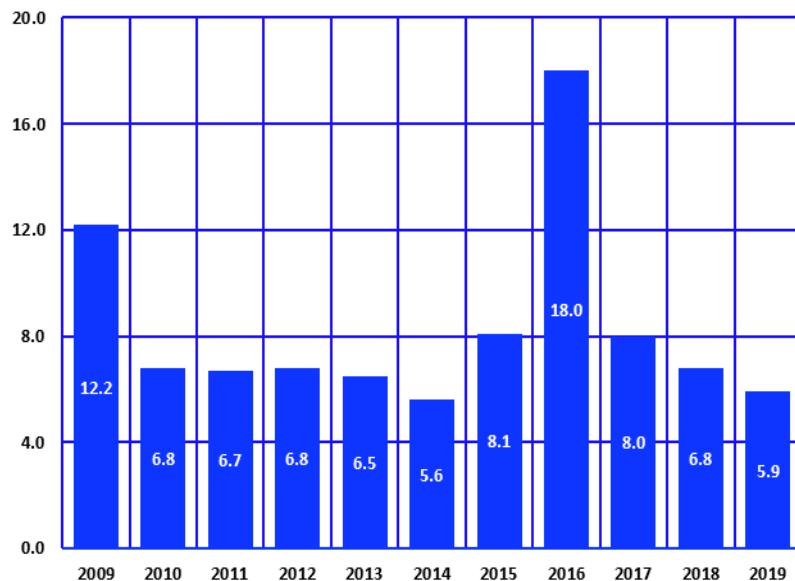

3A. NON-SEXUALLY TRANSMITTED DISEASES

Shigellosis is an infectious disease caused by a group of bacteria called *Shigella* that can cause diarrhea in humans. To spread from one person to another, *Shigellae* can be transmitted through contaminated foods, sexual contact, and water used for drinking or recreational purposes.

From 2009–2019, *shigellosis* was the most common enteric disease to afflict Arizonans after *campylobacteriosis* and *salmonellosis* (**Table 3A-1**).

The number of reported cases of *shigellosis* has decreased by 52 cases from 478 in 2018 to 426 in 2019. Compared to 2018, the incidence rate of *shigellosis* was 13.2 percent lower at approximately 6 reported cases/100,000 population in 2019 (**Figure 3A-3**).

Figure 3A-3
Trends in the Incidence Rates^a of Shigellosis by Year,
Arizona, 2009-2019

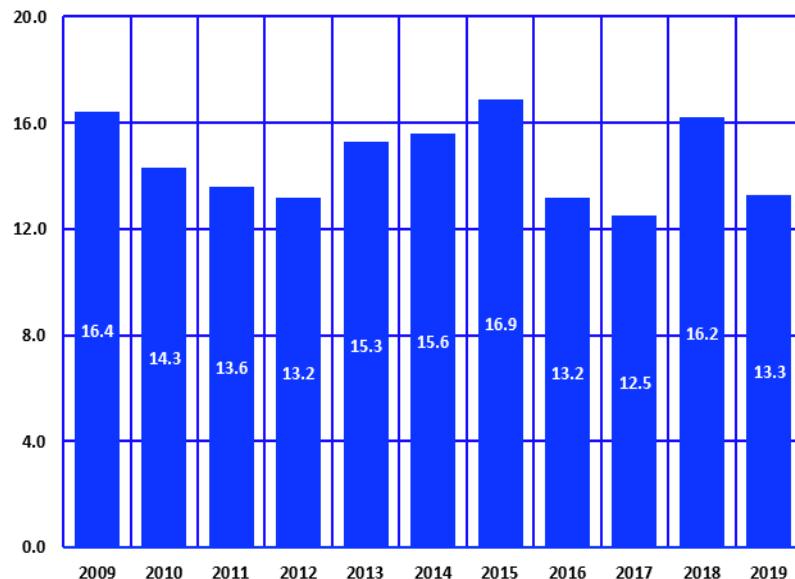

Note: ^a Number of reported cases per 100,000 population.

Figure 3A-4
Trends in the Incidence Rates^a of Salmonellosis^b by Year,
Arizona, 2009-2019

Salmonellosis is a bacterial infection. Most of those who are infected with *Salmonella* develop diarrhea, fever, and abdominal cramps.

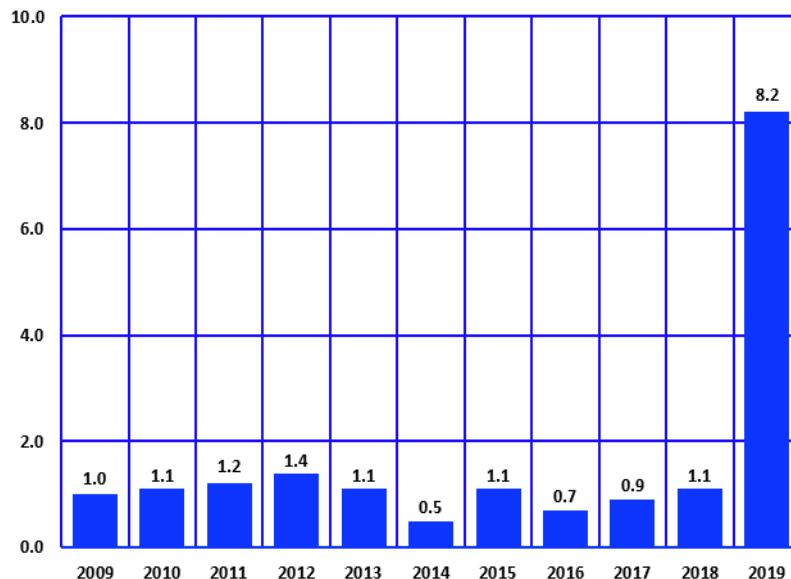

The incidence rate of *salmonellosis* decreased 17.9 percent from 16.2/100,000 in 2018 to 13.3/100,000 in 2019 (**Figure 3A-4**). The risk of *salmonellosis* was substantially higher in Graham (46.8/100,000), Santa Cruz (37.6/100,000), Apache (27.9/100,000), and Navajo (25.7/100,000) than the remaining counties (**Table 5F-2**).

Notes: ^a Number of reported cases per 100,000 population; ^b Excluding S. Typhi and S. Paratyphi.

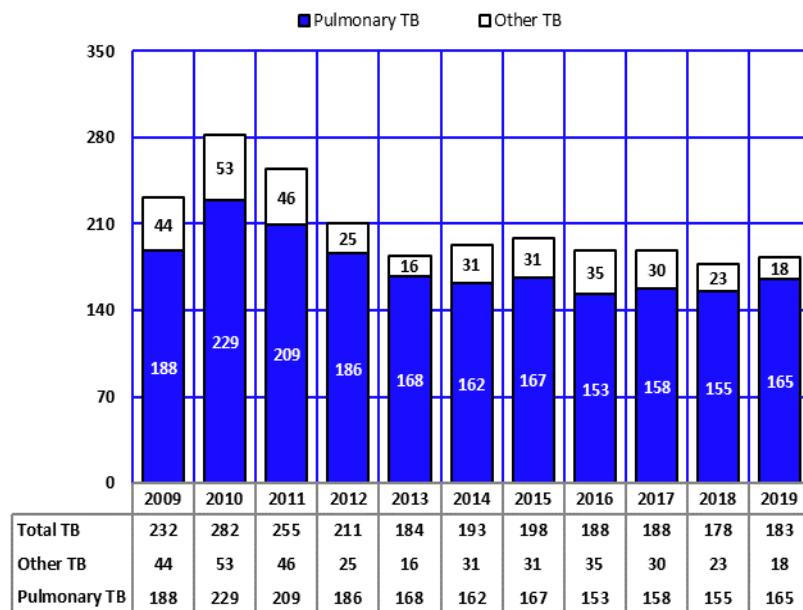

3A. NON-SEXUALLY TRANSMITTED DISEASES

Figure 3A-5
**Trends in the Incidence Rates^a of Hepatitis A by Year,
 Arizona, 2009-2019**

Note: ^a Number of reported cases per 100,000 population.

Figure 3A-6
Trends in the Incidence of Pulmonary Tuberculosis and Total Tuberculosis^a by Year, Arizona, 2009-2019

Note: ^a Number of reported cases by year.

Hepatitis A is a liver disease caused by the *hepatitis A* virus. During 1995-1996, highly effective *hepatitis A* vaccines became available in the United States. Routine childhood vaccination for *hepatitis A* was recommended in 1999. The expansion of recommendations for routine *hepatitis A* vaccination to include all children in the United States aged 12-23 months is likely to reduce hepatitis rates further.

In Arizona, the incidence rate of *hepatitis A* was 8.2/100,000 in 2019, the highest rate recorded in the 2009-2019 period. The 2019 incidence rate was approximately 8 times higher than the 2018 rate (1.1/100,000; **Figure 3A-5**).

Tuberculosis (TB) is an infectious disease that usually attacks the lungs, but can attack almost any part of the body. Tuberculosis is spread from person to person through the air.

The number of reported cases of *pulmonary tuberculosis* increased from 155 cases in 2018 to 165 reported cases in 2019. The number of reported cases of tuberculosis other than pulmonary decreased from 23 in 2018 to 18 in 2019 cases (**Figure 3A-6, Table 3A-1**). The incidence rate of *total tuberculosis* remained unchanged from 2018 to 2019 at 2.5/100,000 (**Table 5F-2**).

Pulmonary tuberculosis accounted for 90.2 percent of all tuberculosis infections in 2019 (**Table 3A-1**). Ten Arizonans who had *tuberculosis* died from it in 2019, the same number of casualties as in 2018 (**Table 3A-2**).

Yersiniosis (except <i>Y. pestis</i>)	7	*	6	10	9	*	12	14	20	11	58

Notes: * Cell suppressed due to non-zero count less than 6; Non-resident cases have been excluded. Only incident cases are reported. Cases are counted by date reported to public health. Case counts include both probable and confirmed cases unless otherwise indicated. *E. coli* has included both *E. coli* O157:H7 and Shiga-toxin positive *E. coli* since October 2004. *Haemophilus influenzae* type B includes all invasive *H. influenzae* B, not just meningitis, as of 1995. Meningococcal disease includes all invasive disease caused by *Neisseria meningitidis*, not just meningitis. Animal rabies cases are not included. Reported coccidioidomycosis cases were elevated from June 2009 through December 2012 and then declined in 2013 due to changes in reporting practices and laboratory testing from a major commercial laboratory. A change in the criteria for counting Lyme disease in 2013 may account for the increase in cases in that year. Aseptic meningitis and Reyes syndrome ceased being reportable in January 2018. For additional statistics on these diseases, please see:

<https://azdhs.gov/preparedness/epidemiology-disease-control/index.php#data-stats>

3B.

SEXUALLY TRANSMITTED DISEASES

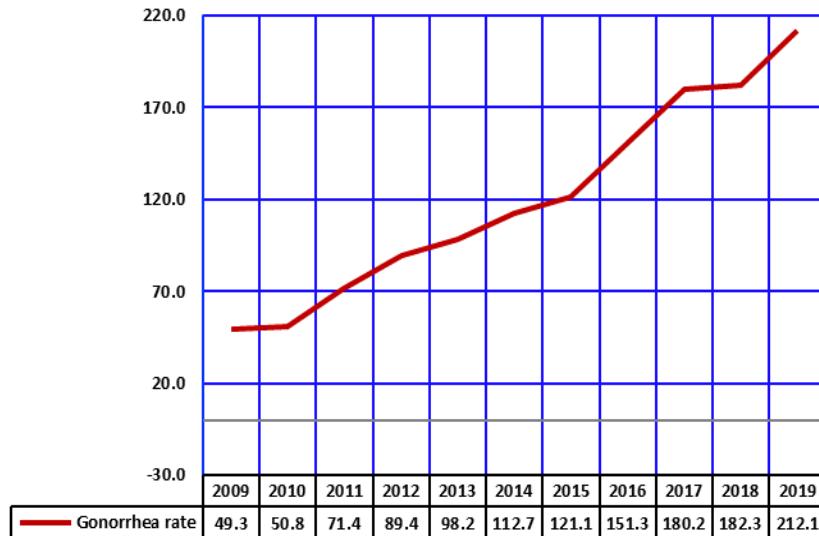

All states require that certain sexually transmitted diseases (STDs) be reported by physicians and other health care providers when they suspect that a case has occurred or they have laboratory confirmation.

It is important to note that disease reporting is likely incomplete and completeness may vary depending on the disease. Moreover, changes in methods for public health surveillance, or implementation of new diagnostic tests can cause changes in disease reporting that are independent of the true incidence of disease.* In this section, STD rates were calculated using denominators from the CDC for years prior 2018. In the current report, the Arizona Department of Health Services denominators were used to compute the STD rates.

*Centers for Disease Control and Prevention. Summary of notifiable diseases – United States, 2008. Published June 25, 2010, for 2008; Vol. 57 (No. 54). Available online at <http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5754a1.htm>

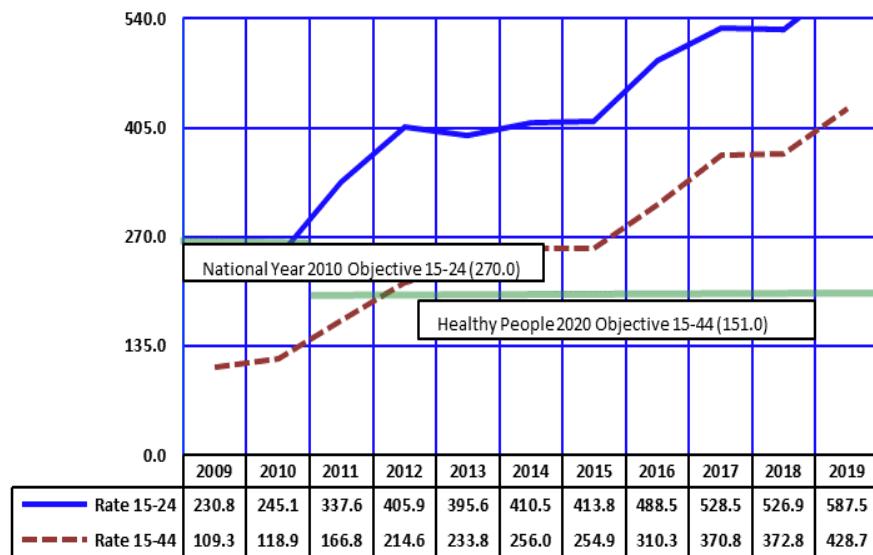

3B. SEXUALLY TRANSMITTED DISEASES

Figure 3B-1
Trends in the Incidence Rates^a of Gonorrhea by Year, Arizona, 2009-2019

Note: ^a Number of reported cases per 100,000 population.

Figure 3B-2
Trends in the Incidence Rates^a of Gonorrhea among Females aged 15-24 and 15-44 Years, Arizona, 2009-2019

Neisseria gonorrhoeae infection is the second most commonly reported notifiable disease in the United States. (Figure 3B-1). The consistent steady increase in the incidence rate of gonorrhea since 2009 likely resulted from a combination of factors, such as changes in surveillance, increases in the number of tests performed, and actual increases in disease occurrence (Figure 3B-1).

The *Healthy People 2010* objective HP25-2 defines the target rate for gonorrhea as equal to or lower than 19.1 cases per 100,000 population. However, the *Healthy People 2020* target is for ages 15-44 and is set at 151.0/100,000 females and 147.0/100,000 males (Table 6A-2).

The 2019 incidence rate for gonorrhea was 428.7 per 100,000 for Arizona females aged 15-44 years, meaning Arizona's incidence rate was higher than the *Healthy People 2020* objective. Generally, the trends in gonorrhea incidence rates are similar for women in the age groups 15-24 and 15-44, although the overall incidence rate is consistently higher for women aged 15-24.

Notes: ^a Number of reported cases per 100,000 females; There was a change in target rate and age range for Healthy People 2020 objective. In National Year 2010 objective was for females aged 15 and 24 years. In Healthy People 2020 objective is for females aged 15 and 44 years.

3B. SEXUALLY TRANSMITTED DISEASES

Chlamydia trachomatis is the most prevalent bacterial sexually transmitted disease in the United States (1,758,668 cases in 2018*) with the highest rates reported among adolescents and young adults (**Table 3B-4**). Recent availability of sensitive tests for *chlamydia* using DNA amplification technology undoubtedly contributed to the increase in the number of reported cases in Arizona over the last decade (**Figure 3B-3**, **Table 3B-1**).

The incident rate of chlamydia was previously reported for females aged 15-24 years, however based on changes in *Healthy People 2020*, it would be reported for females 15-44 years. The *Healthy People 2020* goal for chlamydia is set at 1,478.2 per 100,000 females. The incidence rate for Arizona in 2019 was 1,965 per 100,000 females age 15-44 years (**Table 6A-2**).

*Most recent publication <http://www.cdc.gov/std/stats18/chlamydia.htm>

Notes: ^a Number of reported cases per 100,000 females; There was a change in target rate and age range for Healthy People 2020 objective. In National Year 2010 objective was for females aged 15-24 years. In Healthy People 2020 objective is for females aged 15-44 years.

Congenital syphilis is an infection caused by the spirochete *Treponema pallidum*, which can be passed from the mother to child during fetal development or birth. Not all infants born to infected women will be infected.

In 1988, CDC implemented a new Congenital syphilis case definition. It no longer relies on documentation of infection in the infant; rather, it presumes that an infant is infected if it cannot be proven that an infected mother was adequately treated for syphilis before or during pregnancy.

The *Healthy People 2020* goal for congenital syphilis is 14.5 cases per 100,000, which has been surpassed by Arizona in each year from 2009 to 2019, with sole exception of 2014. The Arizona incidence rates of congenital syphilis were for the most part below 20 cases per 100,000 infants, with exception to years prior 2010 and after 2016. In 2017, a sharp increase in the incidence was recorded (36.7/100,000), in 2018, the rate more than doubled at 75.7/100,000 and in 2019, the rate was the highest recorded during the 11-year period. (**Figure 3B-4**, **Table 6A-2**).

3C.

HUMAN IMMUNODEFICIENCY VIRUS (HIV) DISEASE AND ACQUIRED IMMUNODEFICIENCY SYNDROME (AIDS)

Statistics about the estimated incidence of Human Immunodeficiency Virus (HIV) disease and Acquired Immunodeficiency Syndrome (AIDS) for 1981-2019, as provided by the Office of HIV, STD, and Hepatitis Services, are available in Tables 3C-1, 3C-2, 3C-3, 3C-4, and 5F-3 of this report. In the past, the cases of persons previously reported as HIV positive and subsequently diagnosed with AIDS were not properly counted since these were not new cases, only a new diagnosis reflecting a progression of the disease. The data presented in this report are based on a revised approach adopted by the Office of HIV/AIDS Services. The estimated incidence of HIV/AIDS includes the sum of new HIV cases and new AIDS cases, which were not diagnosed as HIV positive in any prior calendar year. The cases of persons who were diagnosed with both HIV and AIDS in the same calendar year are counted only as AIDS to avoid double counting.

3C. HIV DISEASE AND AIDS

Figure 3C-1
**Reported Cases of HIV/AIDS by Gender and Year of Diagnosis,
Arizona, 2009-2019**

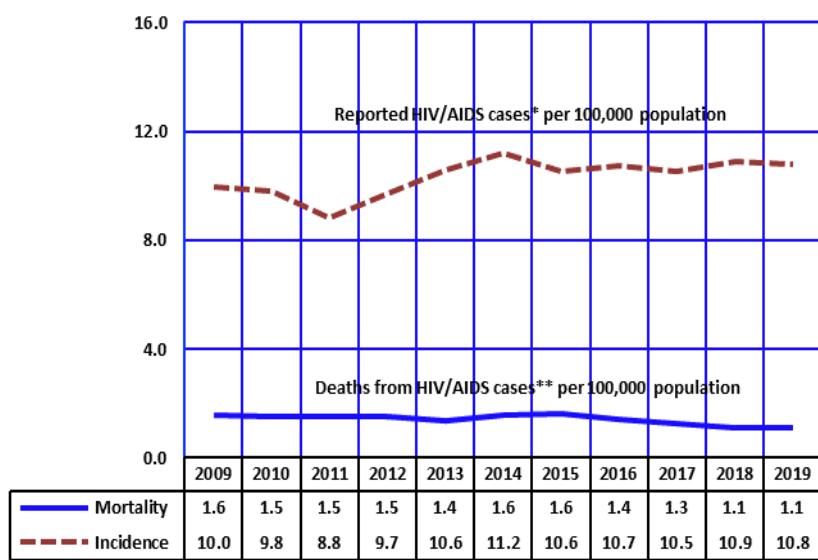

Since the first case of AIDS diagnosed in an Arizona resident in 1981, a total of 25,045 cases of HIV/AIDS had been diagnosed in the State by the end of 2019 and reported by July 1, 2020 (**Table 3C-1**).

In 2019, males accounted for 84.8 percent of all HIV/AIDS diagnoses. The male-to-female ratio of HIV/AIDS diagnoses in Arizona in 2019 was 5.6:1 (659/118; **Figure 3C-1, Table 3C-2**).

The proportion of risk behaviors attributed to emerging cases of HIV/AIDS in 2019 remained similar to previous years. Of the 777 HIV/AIDS cases diagnosed in 2019, 449 were among men who reported sexual contact with other men (**Table 3C-4**). Another 65 reported heterosexual contact. An additional 51 reported only injecting drugs. Adults without an indicated risk accounted for 165 of HIV/AIDS cases diagnosed in 2019.

Figure 3C-2
**Trends in the Incidence Rates of HIV/AIDS and Mortality Rates for HIV Disease
by Year, Arizona, 2009-2019**

The incidence rate measures the relative risk for HIV/AIDS in a population. The incidence rate of HIV/AIDS has increased in Arizona by 8.0 percent from 10.0 cases per 100,000 population in 2009 to 10.8/100,000 in 2019 (**Figure 3C-2**; the incidence rates for 2009 – 2019 have been re-computed based on the latest volume of the HIV/AIDS data as of 8/3/2020).

The rate of deaths from HIV disease remained unchanged from 2014 to 2015, then decreased slightly at 1.4 deaths per 100,000 population in 2016 to 1.1 both in 2018 and 2019 (**Figure 3C-2**).

Of the 777 HIV/AIDS cases diagnosed in 2019, 250 were White non-Hispanic, 327 were Hispanic, 134 were Black, 39 were American Indian, and 14 were Asian or Pacific Islander (**Table 3C-3**).

Notes: *By year of diagnosis; **By year of death.
