PURPOSE

In 2000, Alzheimer's disease was the 7th leading cause of death for all ages, a ranking that changed as the 6th leading cause of death in 2020 and resumed as the 7th leading cause in 2021. Alzheimer's disease is a progressive degenerative and increasingly debilitating condition characterized by progressive loss of memory, difficulty in finding right words or understanding what people are saying, difficulty in performing previously routine tasks, and changes in personality. Alzheimer's disease gradually destroys vital nerve cells in the brain. At later stages of the disease, persons with Alzheimer's disease are bedridden and susceptible to developing other medical conditions, especially pneumonia. These secondary conditions may also result in death.

The purpose of this report is to provide information to individuals interested in Alzheimer's disease mortality among Arizona residents. The data for 2021 are placed in a temporal context by comparison with the data for the preceding years.

METHODS AND SOURCES

Data on the number and characteristics of Alzheimer's deaths were obtained from the death certificates filed with the Arizona Department of Health Services. Population denominators for Arizona residents, used to calculate rates, are the latest available estimates by the Arizona Office of Economic Opportunity and census enumerations from the U.S. Census Bureau (www.census.gov/).

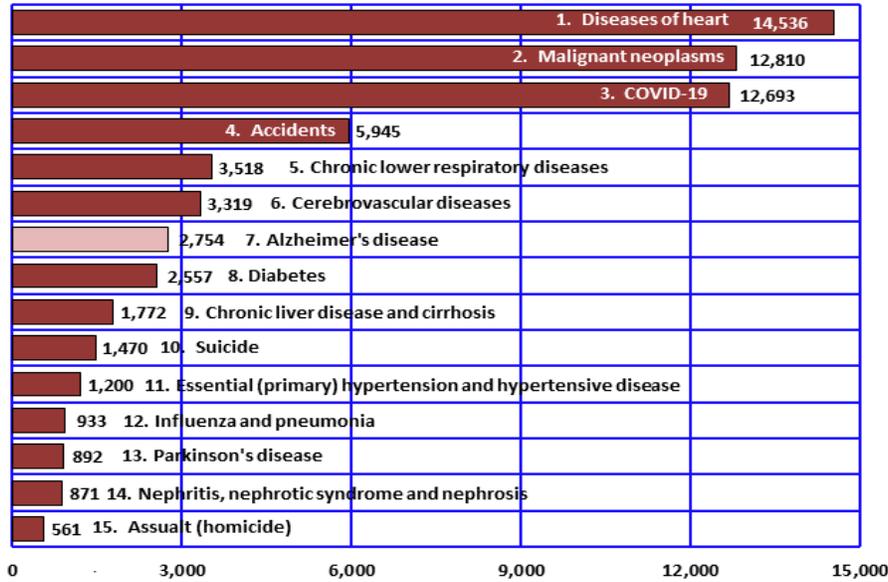

Beginning with the 2000 data year, two major changes have occurred in Arizona, affecting the computation of mortality rates, tabulation of leading causes of death and analyses of mortality data over time. First, a new revision of the International Classification of Diseases (ICD), used to classify causes of death, was implemented. The Tenth Revision (ICD-10) has replaced the Ninth Revision (ICD-9), which was in effect since 1979. Second, a new population standard for the age adjustment of mortality rates has replaced the standard based on the 1940 population and used since 1943.

Both changes have profound effects on the comparability of mortality data and continuity in statistical trends. Age-adjusted rates can only be compared to other age-adjusted rates that use the same population standard.

Breaks in comparability of mortality statistics effective with deaths occurring in 2000 also result from the implementation of ICD-10. Any comparison of causes of mortality in Arizona from the 2000-2021 period and prior years needs to take into account the changes in statistical trends that can be attributed to changes in the classification system alone.

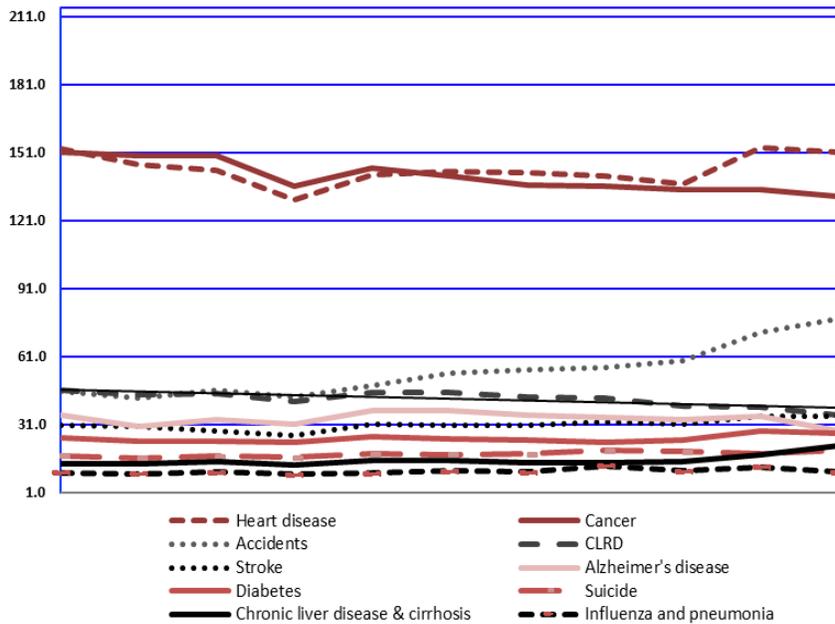

This report includes tables where small cells and related totals are suppressed. Using suppression rules similar to those used by the National Center for Health Statistics (NCHS), this report now attempts to maintain the anonymity of the individuals whose vital records are summarized herein. In cell suppression, the first task is primary suppression, or removing non-zero counts in the body of a table that fall below a certain number. Primary cells that were less than six but greater than zero were suppressed and identified with an asterisk (*). Next, secondary suppression is used to obfuscate the totals or sums with components, or addends that fall below the threshold for primary suppression. These totals are typically reported in the margins of table rows and columns. Column or row totals that contained a non-zero addend less than 6 were rounded to the nearest tens-unit and identified with a dagger (+). In certain cases where these rules would have dictated the rounding of a row or column total but the value of the information contained in the total was identified as important or attainable from other sources, these rules were relaxed and the original value was reported.

Figure 1
Alzheimer's Disease among the Leading Causes of Death
Arizona, 2021

In 2021, Alzheimer's disease was the 7th leading cause of death for all ages, accounting for a total number of 2,754 deaths in Arizona (**Figure 1**). More Arizonans died in 2021 from Alzheimer's disease than they did from other chronic diseases, such as diabetes, chronic liver disease and cirrhosis, or nephritis (kidney disease).

Figure 2
Trends in Age-Adjusted Mortality Rates for Alzheimer's
Disease and other Leading Causes of Death by Year,
Arizona, 2011-2021

The trend in mortality from Alzheimer's disease (**Figure 2**) reflects a number of factors such as 1) changes in attitudes of physicians and the public about attributing Alzheimer's disease as a cause of death, 2) availability of improved diagnostic procedures, 3) increase in the number of deaths attributed to Alzheimer's disease due to changes in coding and classification of causes of mortality.

Figure 3
Age-Adjusted Mortality Rates for Alzheimer’s Disease
by Gender and Year, Arizona, 2011-2021

The age-adjusted mortality rate for Alzheimer’s disease decreased by 19.6 percent from 35.2/100,000 in 2011 to 28.3/100,000 in 2021 (**Figure 3**). The decrease in age-adjusted mortality rate for Alzheimer’s disease was reflected among females (13.3 percent) and males had a showed decrease (26.3 percent) during that time.

In 2011, the risk that a female would die from Alzheimer’s compared to a male was 34.9 percent greater. In 2021, however, the female-to-male mortality risk has increased to 58.7 percent.

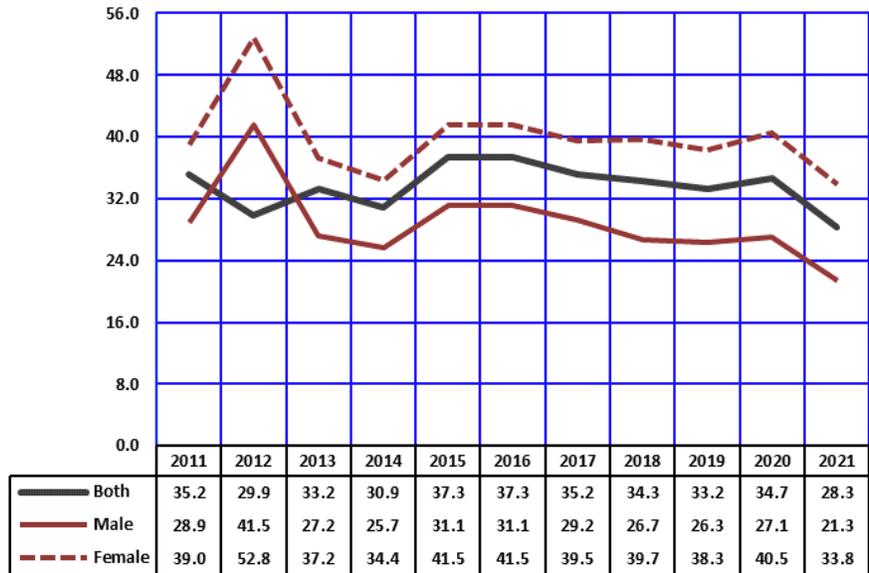

Figure 4
Age-Adjusted Mortality Rates for Alzheimer’s Disease
by Gender and Race/Ethnic Group, Arizona, 2021

The 2021 death rate for Alzheimer’s disease among Hispanic or Latino females was the highest among all race/gender groups in Arizona (**Figure 4**). Hispanics and White non-Hispanics had the highest death rates for Alzheimer’s disease among males.

White non-Hispanic females accounted for 1,510 deaths from Alzheimer’s disease (or 81.8 percent of all Alzheimer’s deaths among Arizona females), while White non-Hispanic males accounted for 758 deaths (or 83.4 percent of all Alzheimer’s deaths).

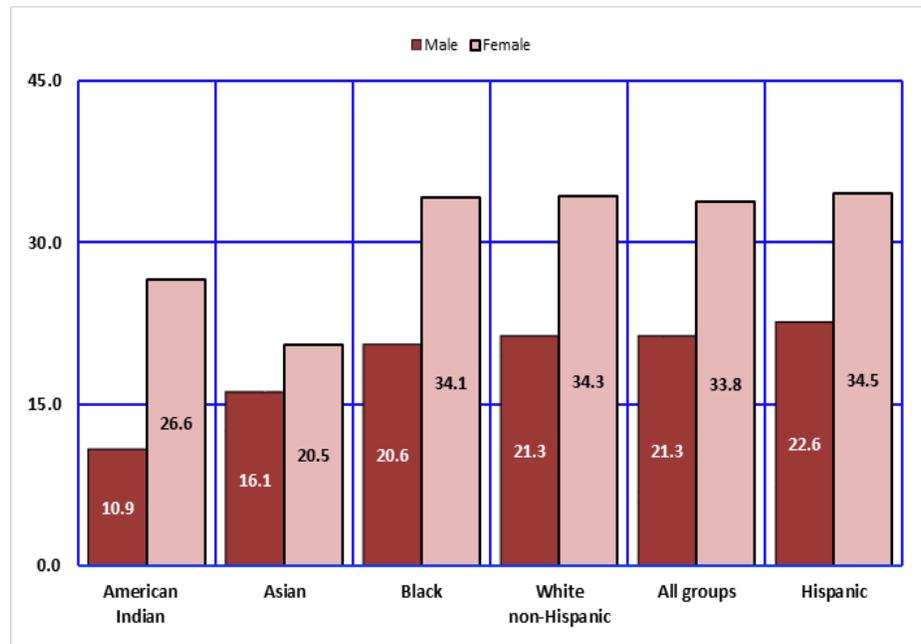

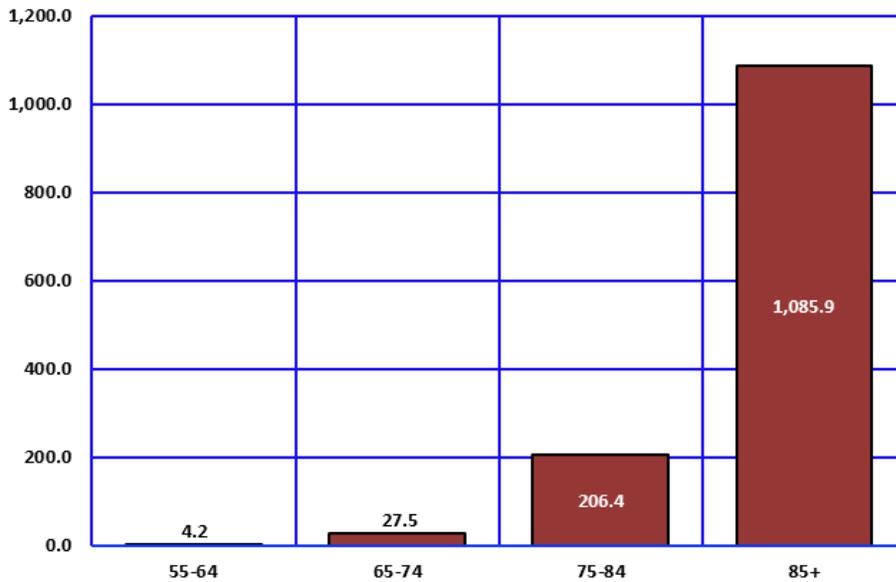

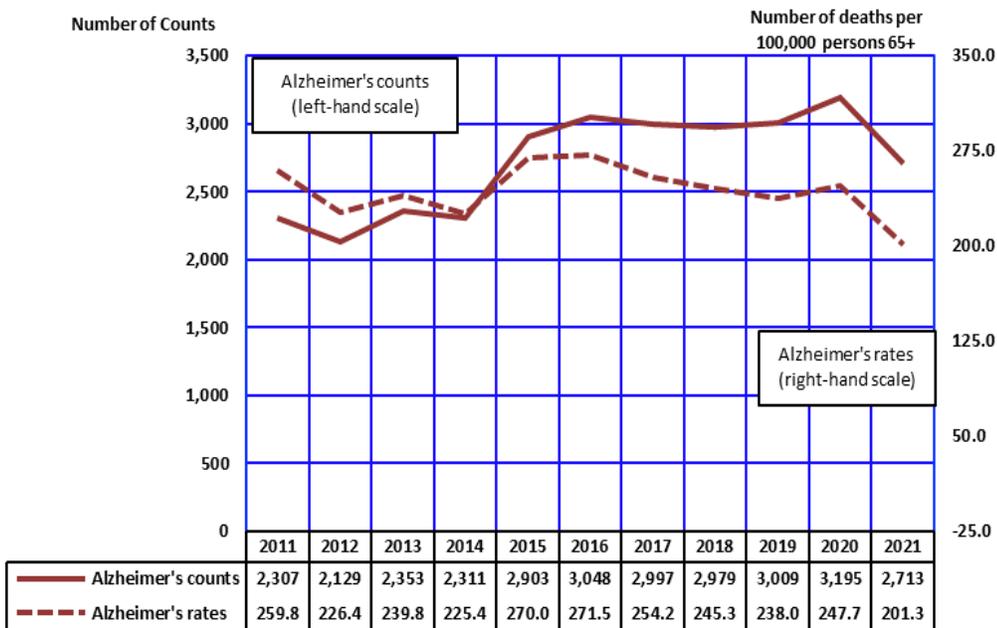

Figure 5
Age-Specific Mortality Rates for Alzheimer’s Disease
among Arizonans Aged 55 Years and Older, 2021

The risk of mortality from Alzheimer’s disease increases sharply with age (**Figure 5**). In 2000, nine out of every ten deaths from Alzheimer’s disease were to persons aged 75 years and older. Similarly, in 2021 the risk of death from Alzheimer’s was greater for Arizonans aged 75 years or older.

Figure 6
Mortality and Mortality Rates for Alzheimer’s Disease among
Arizona Elderly Residents 65 Years and Older, 2011-2021

The number of Alzheimer’s deaths is higher than 2011, but has seen a decline from 2020. The mortality rate from Alzheimer’s disease was marked by a 22.5 percent decrease from 2011 to 2021 (**Figure 6**).

Figure 7
Mortality Rates for Alzheimer’s Disease by Gender and Year
among Arizona Elderly Residents 65 Years and Older,
2011-2021

The death rate for Alzheimer’s disease, the fourth leading cause of elderly female mortality in Arizona had a large decrease from 2011 (319.4/100,000) to 2021 (250.4/100,000; **Figure 7**). For elderly males, the mortality rate for Alzheimer’s disease, the eighth leading cause of death among this group, decreased by 23.9 percent from 188.6/100,000 in 2011 to 143.6/100,000 in 2021. In 2011, the Alzheimer’s disease mortality risk of elderly females compared to males was 69.4 percent greater, while in 2021 the risk was 74.4 percent greater.

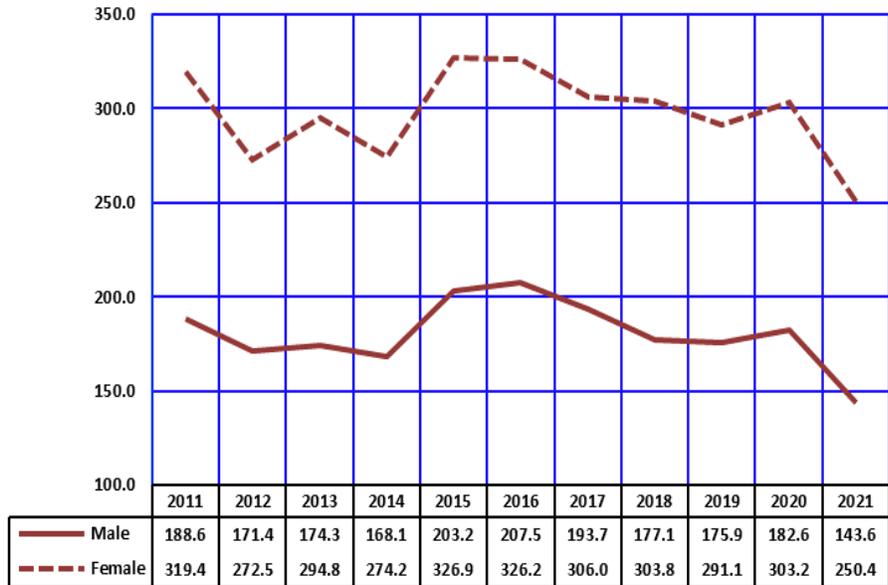

Figure 8
Mortality Rates for Alzheimer’s Disease by Gender and Year
among Arizonans 75-84 Years Old, 2011-2021

Mortality rates for Alzheimer’s disease among Arizonans 75-84 years old were higher among females than males from 2011 to 2021 (**Figure 8**). In 2011, the Alzheimer’s disease mortality risk of elderly females compared to males in this age group was 22.5 percent greater, while in 2021 the risk was 39.8 percent greater.

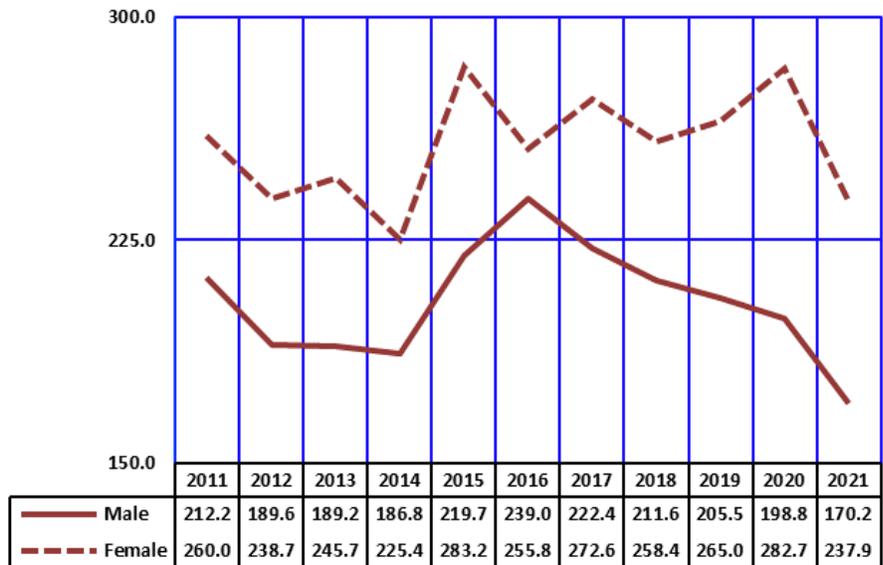

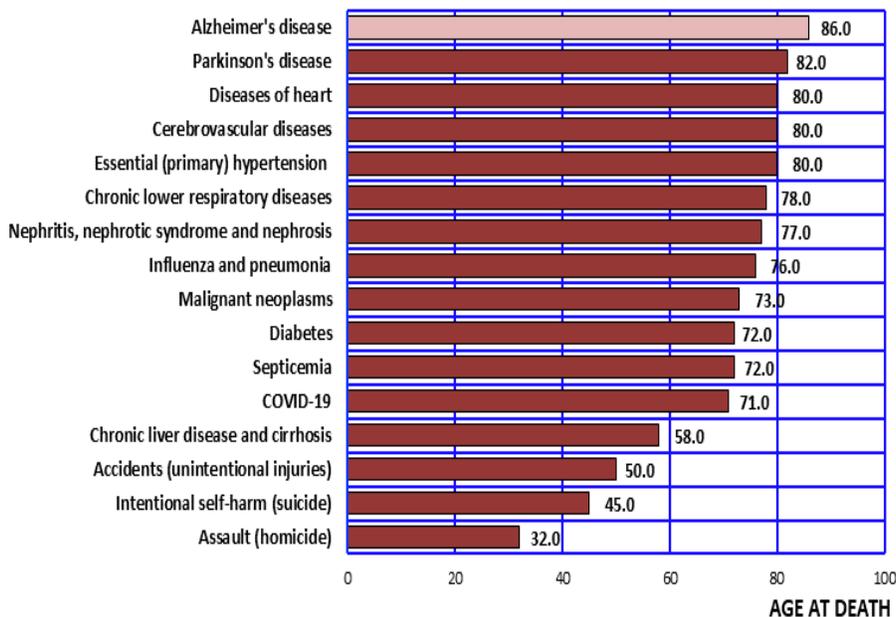

Figure 9
Mortality Rates for Alzheimer's Disease by Gender and Year
among Arizonans 85 Years and Older, 2011-2021

Among Arizonans 85 years and older, the mortality rates for Alzheimer's disease among females exceeded the male rates in every year from 2011 to 2021 (**Figure 9**). In 2011, the *Alzheimer's disease* mortality risk of elderly females compared to males in this age group was 47.8 percent greater, while in 2021 the risk was 73.5 percent greater.

Figure 10
Average Age at Death for Selected Leading Causes
of Death, Arizona, 2021

In 2021, Alzheimer's disease had the highest average age at death of 86.0 years, exceeding the average age at death for all causes by 14.8 years (**Figure 10**). Only 11.4 percent of deaths from Alzheimer's disease occurred before the age of 76.1 years, i.e., before the expected years of life were reached.

Figure 11
Percent of Elderly 65+ by Race/Ethnicity and Proportional Contribution to Mortality from Alzheimer’s Disease, Arizona, 2021

White non-Hispanic elderly residents of Arizona disproportionately contributed to total mortality from Alzheimer’s disease. In 2021, White non-Hispanics accounted for 79.3 percent of all elderly 65 years and older, but 82.3 percent of all deaths from Alzheimer’s disease (**Figure 11**).

White non-Hispanic residents of the state may be at higher risk for Alzheimer’s disease because they live longer than the other race/ethnic groups. In 2021, White non-Hispanics were the only group with less than 50 percent of all deaths occurring before the expected years of life were reached.

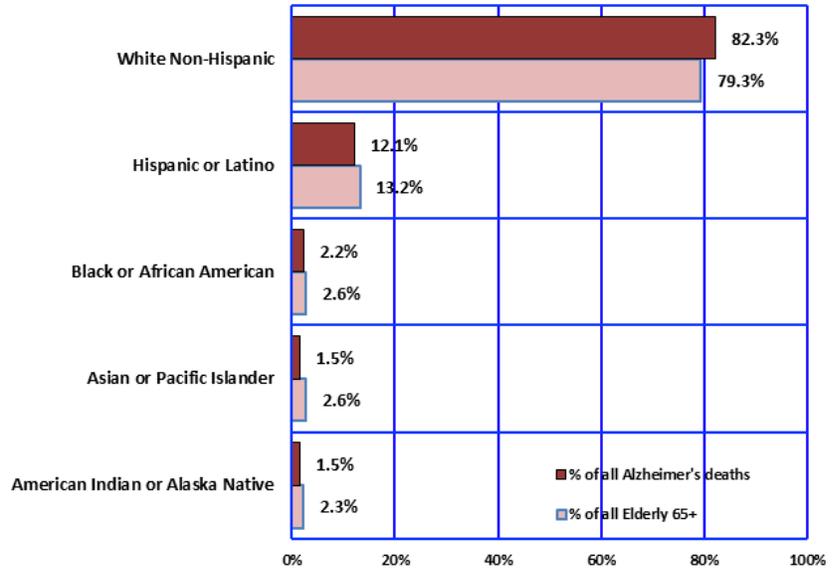

Figure 12
Age-Adjusted Mortality Rates for Alzheimer’s Disease by Gender in Urban and Rural Areas, Arizona, 2021

In 2021, the mortality rate for Alzheimer’s disease was 9.5 percent higher for urban (28.8/100,000) than rural (26.3/100,000) residents of the state (**Figure 12**). The mortality disadvantage of the urban compared to rural residents was particularly pronounced among males (20.2 percent) than females (2.4 percent).

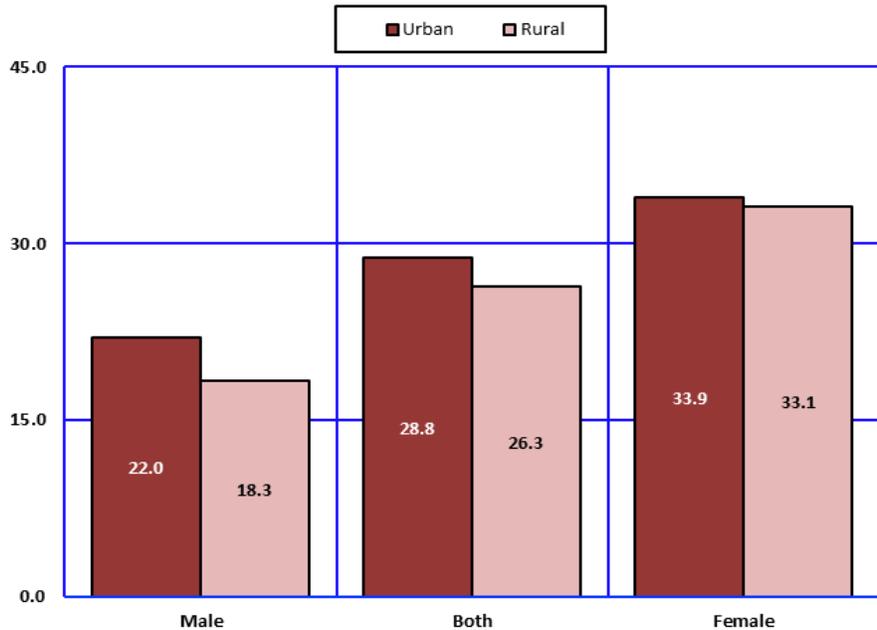

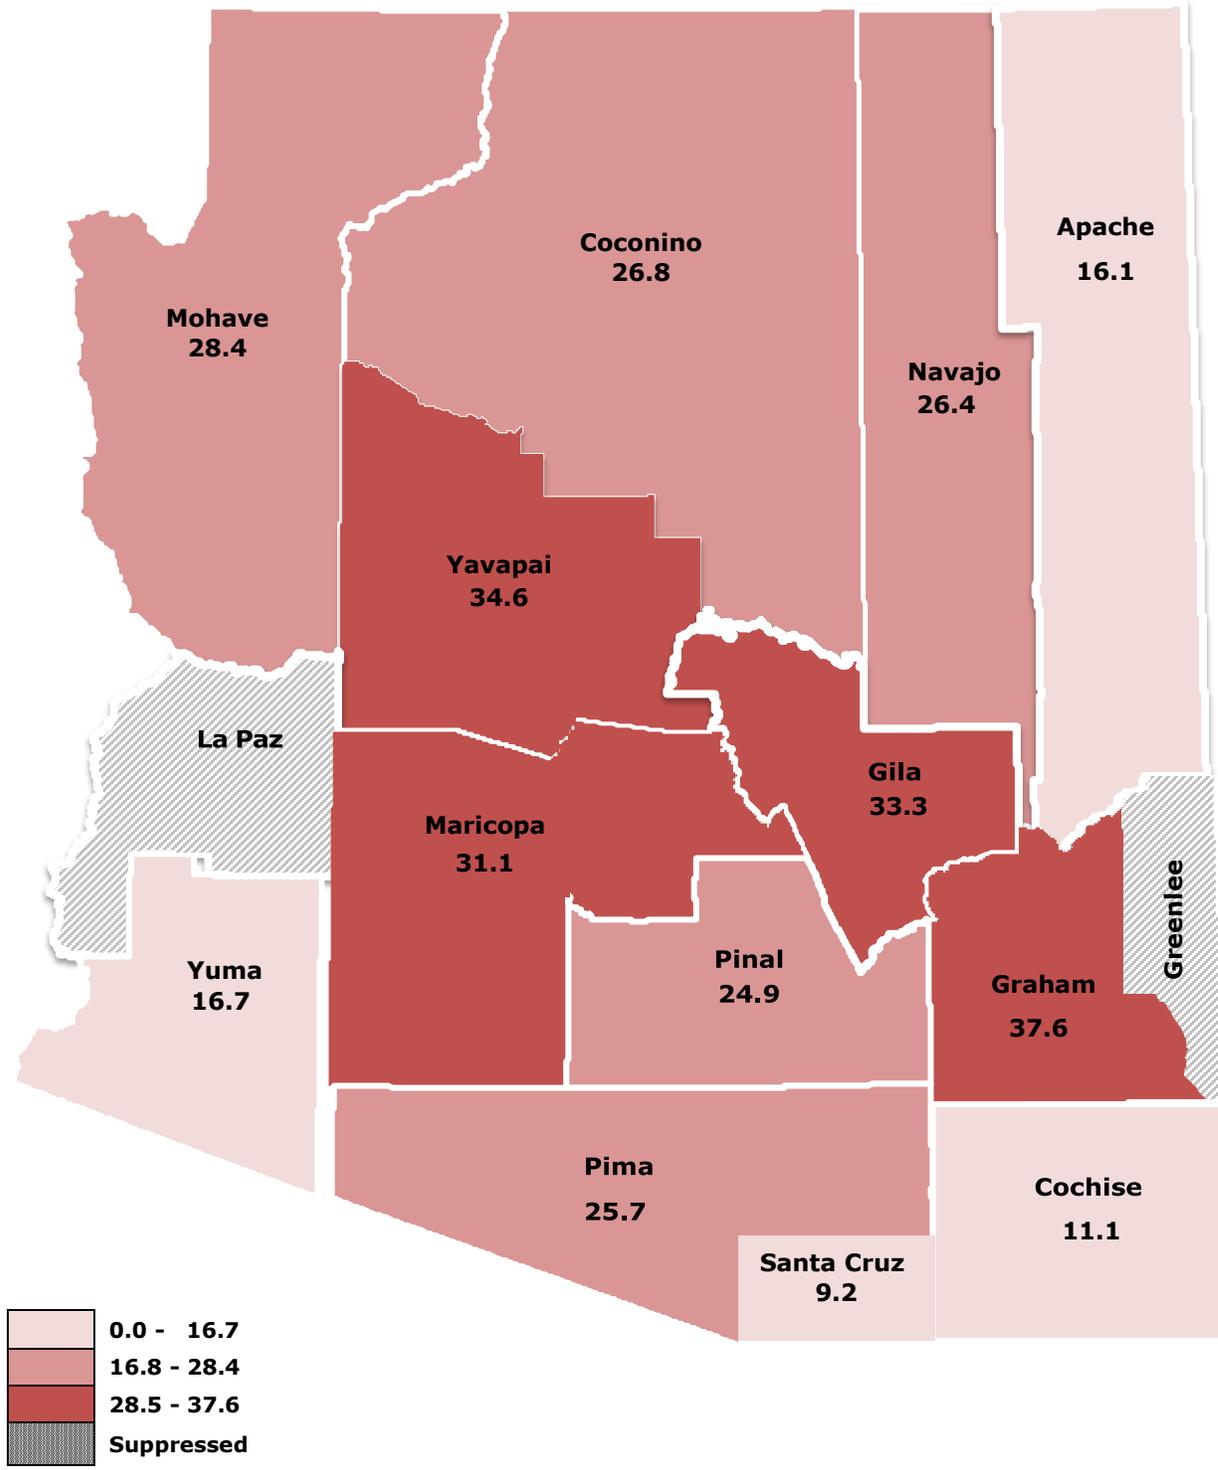

Figure 13
Age-Adjusted Mortality Rates* for Alzheimer's Disease by County of Residence, Arizona, 2021

***Per 100,000 population age-adjusted to the 2000 U.S. standard.**

In 2021, mortality from Alzheimer's disease among the fifteen Arizona counties ranged from a rate of 9.2 deaths per 100,000 persons in Santa Cruz County to a rate of 37.6 deaths per 100,000 persons in Graham County (Figure 13).

MORTALITY FROM ALZHEIMER'S DISEASE AMONG ARIZONA RESIDENTS, 2011-2021

DATA TABLES

**TABLE 1
NUMBER OF DEATHS FROM ALZHEIMER'S DISEASE AND OTHER LEADING CAUSES OF MORTALITY BY YEAR, ARIZONA, 2011-2021**

Cause of death	Rank (count) in 2011	Rank (count) in 2012	Rank (count) in 2013	Rank (count) in 2014	Rank (count) in 2015	Rank (count) in 2016	Rank (count) in 2017	Rank (count) in 2018	Rank (count) in 2019	Rank (count) in 2020	Rank (count) in 2021
Diseases of heart	2 (10,424)	2 (10,366)	2 (10,497)	2 (9,953)	2 (11,274)	1 (11,820)	1 (12,285)	1 (12,410)	1 (12,560)	1 (14,185)	1 (14,536)

Our Web site at <http://pub.azdhs.gov/health-stats> provides access to a wide range of statistical information about the health status of Arizonans. The Arizona Health Status and Vital Statistics annual report examines trends in natality, mortality, and morbidity towards established health objectives. Additional reports and studies include Advance Vital Statistics by County of Residence, Injury Mortality among Arizona Residents (all injury, accidents, suicides, homicides, legal intervention, undetermined, firearm-related fatalities, drug-related deaths, drowning deaths, falls among Arizonans 65 years or older), Hospital Inpatient and Emergency Room Statistics (first-listed diagnosis, procedures, alcohol abuse, asthma, diabetes, substance abuse, falls, influenza and pneumonia, injury, and mental disorders), Abortions in Arizona, Community Vital Statistics, Teenage Pregnancy, Differences in Health Status Among Racial/Ethnic Groups, Health Status Profile of American Indians in Arizona, Mortality from Alzheimer's Disease, Heart Disease vs. Cancer: An Epidemiologic Transition in Mortality Risks, and Deaths from Exposure to Excessive Natural Heat Occurring in Arizona.
